Electrical and Computer Engineering

Bachelor of Science

Subject-specific Examination Regulations for Electrical and Computer Engineering (Fachspezifische Prüfungsordnung)

The subject-specific examination regulations for Electrical and Computer Engineering are defined by this program handbook and are valid only in combination with the General Examination Regulations for Undergraduate degree programs (General Examination Regulations = Rahmenprüfungsordnung). This handbook also contains the program-specific Study and Examination Plan (Chapter 6).

Upon graduation, students in this program will receive a Bachelor of Science (BSc) degree with a scope of 180 ECTS credits (for specifics see Chapter 4 of this handbook).

1.1 Concept

1.1.1 The Constructor University Educational Concept

Constructor University aims to educate students for both an academic and a professional career by emphasizing three core objectives: academic excellence, personal development, and employability to succeed in the working world. Constructor University offers an excellent research driven education experience across disciplines to prepare students for graduate education as well as career success by combining disciplinary depth and interdisciplinary breadth with supplemental skills education and extra-curricular elements. Through a multi-disciplinary, holistic approach and exposure to cutting-edge technologies and challenges, Constructor University develops and enables the academic excellence, intellectual competences, societal engagement, professional and scientific skills of tomorrows leaders for a sustainable and peaceful future.

In this context, it is Constructor University's aim to educate talented young people from all over the world, regardless of nationality, religion, and material circumstances, to become citizens of the world who are able to take responsible roles for the democratic, peaceful, and sustainable development of the societies in which they live. This is achieved through a high-quality teaching as well as manageable study loads and supportive study conditions. Study programs and related study abroad programs convey academic knowledge as well as the ability to interact positively with other individuals and groups in culturally diverse environments. The ability to succeed in the working world is a core objective for all study programs at Constructor University, both in terms of actual disciplinary subject matter and also to the social skills and intercultural competence. Study-program-specific modules and additional specializations provide the necessary depth, interdisciplinary offerings provide breadth while the university-wide general foundation and methods modules, optional German language and Humanities modules, and an extended internship period strengthen the employability of students. The concept of living and learning together on an international campus with many cultural and social activities supplements students' education. In addition, Constructor University offers professional advising and counseling.

Constructor University's educational concept is highly regarded both nationally and internationally. While the university has consistently achieved top marks over the last decade in Germany's most comprehensive and detailed university ranking by the Center for Higher Education (CHE), it has also been listed by one of the most widely observed university rankings, the Times Higher Education (THE) ranking. More details on the current ranking positions can be found at <https://constructor.university/more/about-us>.

1.1.2 Program Concept

The extensive developments in microelectronics over recent decades have triggered a digital revolution where computers take center stage. While we still think of a computer as a desktop or a laptop, digital computing and digital signal processing have become vital for many of the products in our everyday life such as cars, mobile phones, tablets, cameras, household appliances, and more. The Electrical and Computer Engineering program focuses on the areas of communications and digital

signal processing, including the enabling digital processing elements and their programming. Those enabling technologies are mostly subsumed under the headline of embedded systems.

The first two years of the ECE program offer a rigorous theoretic foundation together with lab experiments that illustrate the principles practically and already show the programming of digital signal processors, printed circuit board design, and advanced measurement tools and procedures. The theoretical education with corresponding labs covers analog and digital circuitry, deterministic and random signal processing, probability and information theory, and communication. Signals covered start from DC and single sinusoids and move over to general deterministic or random functions and also specific ones like audio, speech, and video, enabling students to treat them with the corresponding mathematical and algorithmic tools. Different transmission media are characterized, be it wireline or wireless, and the suitable transmission methods and algorithms are covered together with them. The education in the first two years provides a solid foundation enabling students to do internships in research environments and professionally contribute to industrial projects. Specialization modules in the 3rd year finally guide to the frontiers of current knowledge and technology.

The third year exposes students to advanced topics giving also the chance to already pick graduate level modules, such as protocol aspects and coding theory, also rounds up the knowledge with radio frequency engineering aspects and the programming of FPGAs (Field Programmable Gate Arrays).

During the three-year program, we make students discover over-arching relations between the central concepts, pointing them to links between subjects and modules. This should allow the students to develop a holistic view, e.g., recognizing that all linear transforms are directly linked to each other, hence, show tightly related properties; algorithms in error-correction coding are similar to those in signal processing; a complex baseband signal description for modulation shows links to the basic complex descriptions of sinusoidal signals introduced in the first study year. Students shall be capable to recognize the 'string' linking topics vertically between their study years as well as horizontally between lectures and labs in the same semester. A rigid sequence of contents has been created, ensuring topics following each other smoothly in the right order.

Apart from the major-specific education, the program offers room for orientation and specialization, e.g., by choosing specific minors, offering views into other fields and majors. Additionally, due to the teaching in relatively small groups, many lab modules, the direct relation between students and faculty, and the very individual support in theses and also optional projects, mandatory modules from very different fields, and finally, internship and social activities, provide ample opportunities for interacting with fellow students and faculty, supporting organizational and presentation skills and fostering personal development.

1.2 Specific Advantages of the Electrical and Computer Engineering Program at Constructor University

- Focus on signal processing, communications, and corresponding implementation: The ECE program at Constructor University is designed to reflect the dynamic changes of electrical and computer engineering in industry and society. With a sharp focus on signal processing, communications, and implementation, students will be ready to face the challenges of emerging areas such as Cyber-physical Systems, Internet of Things, Connected Vehicles, Secure Communication, and more.

- Early involvement in research: ECE at Constructor University is strongly research-oriented. Each professor in the department has an independent research group including not only senior, but also junior students, even at the Bachelor studies level, some of whom have their first scientific publication together with ECE faculty at well-recognized journals or conferences.
- Advanced topics in Signal Processing and Communications are treated very early on, making ECE students prepared for advanced internship or research tasks after the 2nd year. The third year then offers some graduate-level modules, making students fit for any graduate school world-wide or professional jobs early on.
- Wide cooperation and open access to instructors: Constructor University as a whole is a flat institution, where professors, research staff, and students engage in open dialog and co-operation without barriers.

1.3 Program-Specific Educational Aims

1.3.1 Qualification Aims

The main subject-specific qualification aim is to enable students to take up a qualified employment in electrical and computer engineering environments, be it manufacturers, providers, sales organizations, consultants, agencies, research centers, or academia itself. Although the program focus is on signal processing and telecommunications, graduates will be prepared for a manifold of ECE environments and others, like, e.g., automotive and energy.

- Electrical and Computer Engineering competence
 Graduates are able to understand, measure, and analyze properties and theoretically describe tasks and possible solutions in signal processing and communications, plan, design, and implement realizations in hard- and software on modern signal processing and FPGA platforms.
- Communication competence
 Graduates are able to communicate subject-specific topics convincingly in both spoken and written form to other ECE graduates, to engineers in general, to industrial or academic colleagues with different backgrounds, as well as to a more general audience, such as non-technical administrators and decision makers or customers.
- Teamwork and project management competences
 Graduates are able to efficiently individually and also in a team, especially when carrying out lab experiments and doing corresponding lab reports jointly they are able to organize their work and work flows. They are familiar with supporting tools for analysis, development, design, measurement, and testing. Graduate should be able to plan and take decisions in a constructive and well justified way and also convey the corresponding reasoning convincingly.
- Learning competence
 Graduates have acquired a solid foundation enabling them to assess their own knowledge and skills, learn effectively and to stay up to date with the latest developments in the fast-changing field of Electrical and Computer Engineering.

- Personal and professional competence

Graduates are able to develop a professional profile, justify professional decisions on the basis of theoretical and methodical knowledge, and critically reflect their behavior, also with respect to its consequences for society.

During the design of the program, corresponding national guidelines (Leitlinien für Bachelor und Master) by VDE (Verein Deutscher Elektrotechniker), ZVEI, Bitcom, and VDEW have been incorporated, as well as experiences of faculty from teaching at other universities in Europe, the US, and Japan.

1.3.2 Intended Learning Outcomes

By the end of the program, students will be able to

1. describe the underlying natural physical foundation, especially Maxwell' equations; describe and apply mathematical basics and tools;
2. describe the underlying theoretical concepts of deterministic and random signals in time and frequency domain;
3. compare results to theoretical limits, e.g., provided by Information Theory;
4. explain and implement signal processing components, methods, and algorithms, having studied the theoretical foundation and having learned programming languages Matlab, C, C++, assembler, VHDL for general-purpose, signal processor platforms, or FPGAs;
5. treat signals with dedicated algorithms, be it audio, video, or from other origin, e.g., by filtering, prediction, compression;
6. design suitable transmission methods for diverse channels, wireline and wireless on the basis of channel properties and models, knowing an almost complete set of transmission methods;
7. know typical electronic components and their standard base circuits and to implement dedicated circuitry, be it analog or digital, including the printed circuit board layout;
8. use advanced measurement equipment, like high-end scopes, spectrum and network analyzers including their remote control;
9. design MAC and higher protocols, error correcting codes, and compression schemes, also know major security schemes and their implementation;
10. use academic or scientific methods as appropriate in the field of Electrical and Computer Engineering such as defining research questions, justifying methods, collecting, assessing and interpreting relevant information, and drawing scientifically-founded conclusions that consider social, scientific, and ethical insights;
11. develop and advance solutions to problems and arguments in Electrical and Computer Engineering and defend these in discussions with specialists and non-specialists;
12. engage ethically with academic, professional and wider communities and to actively contribute to a sustainable future, reflecting and respecting different views;

13. take responsibility for their own learning, personal and professional development, and role in society, evaluating critical feedback and self-analysis;
14. apply their knowledge and understanding to a professional context;
15. take on responsibility in a diverse team;
16. adhere to and defend ethical, scientific, and professional standards.

1.4 Career Options and Support

A recent survey by a German engineering association showed high demand for EE and ECE engineers. Currently, inside Germany alone, there are twice as many positions than graduates, hence, ample job opportunities.

Higher demands for ECE engineers are to be expected. This is partly due to general economic trends, but especially related to unusually low student numbers in recent years. Especially, due to rapid developments, fundamental principles and cross-boundary knowledge become increasingly important. In addition, the required qualification profiles and personal attitudes differ for academic versus industrial careers. The ECE program at Constructor University responds to all of these conditions for a successful career through the flexibility of the program and the trans-disciplinary education. Constructor University ECE graduates start their careers in very diverse companies, successfully continue at renowned universities, or stay with Constructor University for graduate education or a PhD.

Career paths after graduation are very diverse. Constructor University's ECE alumni work in the aerospace industry, telecommunications, the automotive and energy sector, and in the field of information technology, in academia, at research centers, in management and in consultancy, even in finance. Having checked exemplary career paths of 75 former Constructor University ECE students, we found an enormous manifold of companies, research centers, and universities, where our alumni went or are currently working. It starts from well-known big companies, like Bosch, Continental, Deutsche Telekom, E.ON, Ericsson, Google, Infineon, Intel, Nokia Bell Labs, Texas Instruments, Volkswagen, midsize ones, like Kapsch, Hirschmann, OHB, Rohde & Schwartz, to numerous small ones and start-ups like DSI, Snips, to consulting companies like McKinsey, Business Technology Consulting, Deloitte, financial institutions like PricewaterhouseCoopers, OpenLink Financial, even to companies like Fresenius and Procter and Gamble, that would not come to mind immediately as typical work places for ECE graduates. Interestingly, also after intermediate further education steps or employments in other countries, a high percentage of alumni have found their long-term home in Germany and also Bremen.

Further graduate education that our students chose, is also covering a wide spectrum. Graduates have been accepted by universities like TUM, EPFL, ETH, Univ. of Edinburgh, KTH, Eindhoven, KU Leuven, Lausanne, Politecnico di Torino, Berkeley, Rice, UCSD, Constructor University itself.

After PhD, some of our students followed research paths at universities and research centers, like Fraunhofer, DLR, OFFIS, some are already teaching as professors or lecturers. A few earlier students already received prestigious industrial and research awards, like Forbes 30 under 30 and the Donald P. Eckman Award.

In line with the high demand for engineers, all ECE graduates successfully found employment. Likewise, they were able to easily adapt at many graduate schools as the preparation during Bachelor's had already covered contents of graduate modules to the advantage of our students.

In addition to the career support provided by a student's Academic Advisor, the central Career Services Center (CSC) at Constructor University together with the Constructor University Alumni Office support students with high quality training and coaching in C.V. preparation, cover letter formulation, preparation for job interviews, business etiquette, and employer research. Furthermore, the Alumni Office helps students establish a long-lasting and worldwide network which provides support when exploring job options in academia, industry, and elsewhere.

For further information, please contact the Career Service Center (CSC)

<https://constructor.university/student-life/career-services>)

1.5 Admission Requirements

Admission to Constructor University is selective and based on a candidate's school and/or university achievements, recommendations, self-presentation, and performance on standardized tests. Students admitted to Constructor University demonstrate exceptional academic achievements, intellectual creativity, and the desire and motivation to make a difference in the world.

The following documents need to be submitted with the application:

- Recommendation Letter (optional)
- Official or certified copies of high school/university transcripts
- Educational History Form
- Standardized test results (SAT/ACT) if applicable
- Motivation statement
- ZeeMee electronic resume (optional)
- Language proficiency test results (TOEFL Score: 90, IELTS: Level 6.5 or equivalent)

Formal admission requirements are subject to higher education law and are outlined in the Admission and Enrollment Policy of Constructor University.

For more detailed information about the admission visit: <https://constructor.university/admission-aid/application-information-undergraduate>

1.6 More Information and Contacts

For more information on the study program please contact the Study Program Coordinator:

Prof. Dr. -Ing. Mojtaba Joodaki

Professor of Computer Science & Electrical Engineering

Email: mjoodaki@constructor.university

Phone: +49 421 200-3215

Office: Research I, Room 62

or visit our website: <https://constructor.university/programs/undergraduate-education/electrical-computer-engineering>

For more information on Student Services please visit:

<https://constructor.university/student-life/student-services>

2 The Curricular Structure

2.1 General

The curricular structure provides multiple elements for enhancing employability, interdisciplinarity, and internationality. The unique CONSTRUCTOR Track, offered across all undergraduate study programs, provides comprehensive tailor-made modules designed to achieve and foster career competency. Additionally, a mandatory internship of at least two months after the second year of study and the possibility to study abroad for one semester give students the opportunity to gain insight into the professional world, apply their intercultural competences and reflect on their roles and ambitions for employment and in a globalized society.

All undergraduate programs at constructor University are based on a coherently modularized structure, which provides students with an extensive and flexible choice of study plans to meet the educational aims of their major and complete their studies within the regular period.

The framework policies and procedures regulating undergraduate study programs at Constructor University can be found on the website (<https://constructor.university/student-life/student-services/university-policies>).

2.2 The Constructor University 4C Model

Constructor University offers study programs that comply with the regulations of the European Higher Education Area. All study programs are structured according to the European Credit Transfer System (ECTS), which facilitates credit transfer between academic institutions. The three-year under-graduate program involves six semesters of study with a total of 180 ECTS credit points (CP). The undergraduate curricular structure follows an innovative and student-centered modularization scheme, the 4C Model. It groups the disciplinary content of the study program in three overarching themes, CHOICE-CORE-CAREER according to the year of study, while the university-wide CONSTRUCTOR Track is dedicated to multidisciplinary content dedicated to methods as well as intellectual skills and is integrated across all three years of study. The default module size is 5 CP, with smaller 2.5 CP modules being possible as justified exceptions, e.g., if the learning goals are more suitable for 2.5 CP and the overall student workload is balanced.

Figure 1: The Constructor University 4C-Model

2.2.1 Year 1 – CHOICE

The first study year is characterized by a university-specific offering of disciplinary education that builds on and expands upon the students' entrance qualifications. Students select introductory modules for a total of 45 CP from the CHOICE area of a variety of study programs, of which 15-45 CP will belong to their intended major. A unique feature of our curricular structure allows students to select their major freely upon entering Constructor University. The team of Academic Advising Services offers curricular counseling to all Bachelor students independently of their major, while Academic Advisors support students in their decision-making regarding their major study program as contact persons from the faculty.

To pursue ECE as a major, the following CHOICE modules (45 CP) need to be taken as mandatory modules:

- CHOICE Module: General Electrical Engineering I (m, 7.5 CP)
- CHOICE Module: General Electrical Engineering II (m, 7.5 CP)
- CHOICE Module: Classical Physics (m, 7.5 CP)
- CHOICE Module: Digital Systems and Computer Architecture (m, 7.5 CP)
- CHOICE Module: Programming in C and C++ (m, 7.5 CP)
- CHOICE Module: Foundations of Communications and Electronics (m, 7.5 CP)

Students can still change to Robotics and Intelligent Systems (RIS) at the beginning of their second semester, provided they have taken the corresponding mandatory CHOICE module in their first semester. All students must participate in an entry advising session with their Academic Advisors to learn about their major change options and consult their Academic Advisor prior to changing their major.

To allow the major change after the first semester the students are strongly recommended to register for the following CHOICE module:

- Robotics and Intelligent Systems (RIS)
CHOICE Module: Programming in C and C++ (m, 7.5 CP)

2.2.2 Year 2 – CORE

In their second year, students take a total of 45 CP from a selection of in-depth, discipline-specific CORE modules. Building on the introductory CHOICE modules and applying the methods and skills acquired so far (see 2.3.1), these modules aim to expand the students' critical understanding of the key theories, principles, and methods in their major for the current state of knowledge and best practice.

ECE students take the following CORE modules:

- CORE Module: Signals and Systems (m, 7.5 CP)
- CORE Module: Digital Signal Processing (m, 7.5 CP)
- CORE Module: Communications Basics (m, 5 CP)
- CORE Module: Electromagnetics (m, 5 CP)
- CORE Module: Electronics (m, 5 CP)
- CORE Module: Wireless Communication I (m, 5 CP)

- CORE Module: Information Theory (m, 5 CP)
- CORE Module: PCB design and measurement automation (m, 5 CP)

Since Electrical and Computer Engineering has a strongly sequential structure where course contents build onto each other, ECE students will not have the option of a minor in another study program within the 180 CP required for the Bachelor's degree.

2.2.3 Year 3 – CAREER

During their third year, students prepare and make decisions for their career after graduation. To explore available choices fitting individual interests, and to gain professional experience, students take a mandatory summer internship (see 2.2.3.1). The third year of studies allows ECE students to take Specialization modules within their discipline, but also focuses on the responsibility of students beyond their discipline (see CONSTRUCTOR Track).

The 5th semester also opens a mobility window for a diverse range of study abroad options. Finally, the 6th semester is dedicated to fostering the students' research experience by involving them in an extended Bachelor thesis project.

2.2.3.1 Internship / Start-up and Career Skills Module

As a core element of Constructor University's employability approach students are required to engage in a mandatory two-month internship of 15 CP that will usually be completed during the summer between the second and third years of study. This gives students the opportunity to gain first-hand practical experience in a professional environment, apply their knowledge and understanding in a professional context, reflect on the relevance of their major to employment and society, reflect on their own role in employment and society, and find a professional orientation. The internship can also establish valuable contacts for the students' Bachelor's thesis project, for the selection of a Master program graduate school or further employment after graduation. This module is complemented by career advising and several career skills workshops throughout all six semesters that prepare students for the transition from student life to professional life. As an alternative to the full-time internship, students interested in setting up their own company can apply for a start-up option to focus on developing of their business plans.

For further information, please contact the Student Career Support (<https://constructor.university/student-life/career-services>).

2.2.3.2 Specialization Modules

In the third year of their studies, students take 15 CP from major-specific or major-related, advanced Specialization Modules to consolidate their knowledge and to be exposed to state-of-the-art research in the areas of their interest. This curricular component is offered as a portfolio of modules, from which students can make free selections during their fifth and sixth semester. The default Specialization Module size is 5 CP, with smaller 2.5 CP modules being possible as justified exceptions.

To pursue ECE as a major, at least 10 CP from the following mandatory major-specific Specialization Modules need to be taken:

- ECE Specialization: Wireless Communication II (me, 5 CP)

- ECE Specialization: Coding Theory (me, 5 CP)
- ECE Specialization: Digital Design (me, 5 CP)
- ECE Specialization: Radio-Frequency (RF) Design (me, 5 CP)

A maximum of 5 CP can be taken from major-related modules instead of major-specific Specialization Modules:

- RIS Specialization: Optimization (me, 5 CP)
- PHDS Specialization: Nanotechnology (me, 2.5 CP)
- PHDS Specialization: Advanced Optics (me, 2.5 CP)

2.2.3.3 Study Abroad

Students have the opportunity to study abroad for a semester to extend their knowledge and abilities, broaden their horizons and reflect on their values and behavior in a different context as well as on their role in a global society. For a semester abroad (usually the 5th semester), modules related to the major with a workload equivalent to 22.5 CP must be completed. Modules recognized as study abroad CP need to be pre-approved according to Constructor University study abroad procedures. Several exchange programs allow students to directly enroll at prestigious partner institutions worldwide. Constructor University's participation in Erasmus+, the European Union's exchange program, provides an exchange semester at a number of European universities that include Erasmus study abroad funding.

For further information, please contact the International Office (<https://constructor.university/student-life/study-abroad/international-office>).

ECE students that wish to pursue a study abroad in their 5th semester are required to select their modules at the study abroad partners such that they can be used to substitute between 10-15 CP of major-specific Specialization modules and between 5-15 CP of modules equivalent to the non-disciplinary New Skills modules (see CONSTRUCTOR Track). In their 6th semester, according to the study plan, returning study-abroad students complete the Bachelor Thesis/Seminar module (see next section), they take any missing Specialization modules to reach the required 15 CP in this area, and they take any missing New Skills modules to reach 15 CP in this area.

2.2.3.4 Bachelor Thesis/Seminar Module

This module is a mandatory graduation requirement for all undergraduate students. It consists of two module components in the major study program guided by a Constructor University faculty member: the Bachelor Thesis (12 CP) and a Seminar (3 CP). The title of the thesis will appear on the students' transcripts.

Within this module, students apply the knowledge skills, and methods they have acquired in their major discipline to become acquainted with actual research topics, ranging from the identification of suitable (short-term) research projects, preparatory literature searches, the realization of discipline-specific research, and the documentation, discussion, and interpretation of the results.

With their Bachelor Thesis students demonstrate mastery of the contents and methods of their major-specific research field. Furthermore, students show the ability to analyze and solve a well-defined problem with scientific approaches, a critical reflection of the status quo in scientific literature, and

the original development of their own ideas. With the permission of a Constructor University Faculty Supervisor, the Bachelor Thesis can also have an interdisciplinary nature. In the seminar, students present and discuss their theses in a course environment and reflect on their theoretical or experimental approach and conduct. They learn to present their chosen research topics concisely and comprehensively in front of an audience and to explain their methods, solutions, and results to both specialists and non-specialists.

2.3 The CONSTRUCTOR Track

The CONSTRUCTOR Track is another important feature of Constructor University's educational model. The Constructor Track runs orthogonal to the disciplinary CHOICE, CORE, and CAREER modules across all study years and is an integral part of all undergraduate study programs. It provides an intellectual tool kit for lifelong learning and encourages the use of diverse methodologies to approach cross-disciplinary problems. The CONSTRUCTOR track contains Methods, New Skills and German Language and Humanities modules.

2.3.1 Methods Modules

Methods such as mathematics, statistics, programming, data handling, presentation skills, academic writing, and scientific and experimental skills are offered to all students as part of the Methods area in their curriculum. The modules that are specifically assigned to each study programs equip students with transferable academic skills. They convey and practice specific methods that are indispensable for each students' chosen study program. Students are required to take 20 CP in the Methods and Skills area. The size of all Methods and Skills modules is 5 CP.

To pursue ECE as a major, the following mandatory Methods modules (20 CP) need to be taken:

- Methods: Matrix Algebra and Advanced Calculus I (m, 5 CP)
- Methods: Matrix Algebra and Advanced Calculus II (m, 5 CP)
- Methods: Probability and Random Processes (m, 5 CP)
- Methods: Numerical Methods (m, 5 CP)

2.3.2 New Skills Modules

This part of the curriculum constitutes an intellectual and conceptual tool kit that cultivates the capacity for a particular set of intellectual dispositions including curiosity, imagination, critical thought, and transferability. It nurtures a range of individual and societal capacities, such as self-reflection, argumentation and communication. Finally, it introduces students to the normative aspects of inquiry and research, including the norms governing sourcing, sharing, withholding materials and research results as well as others governing the responsibilities of expertise as well as the professional point of view

All students are required to take the following modules in their second year:

- New Skills Module: Logic (m, 2.5 CP)
- New Skills Module: Causation and Correlation (m, 2.5 CP)

These modules will be offered with two different perspectives of which the students can choose. The module perspectives are independent modules which examine the topic from different point of views. Please see the module description for more details.

In the third year, students take three 5 CP modules that build upon previous modules in the track and are partially constituted by modules that are more closely linked to each student's disciplinary field of study. The following module is mandatory for all students:

- New Skills Module: Argumentation, Data Visualization and Communication (m, 5 CP)

This module will also be offered with two different perspectives of which the students can choose.

In their fifth semester, students may choose between:

- New Skills Module: Linear Model/Matrices (me, 5 CP) and
- New Skills Module: Complex Problem Solving (me, 5 CP).

The sixth semester also contains the choice between two modules, namely:

- New Skills Module: Agency, Leadership and Accountability (me, 5 CP) and
- New Skills Module: Community Impact Project (me, 5 CP).

Students who study abroad during the fifth semester and are not substituting the mandatory "Argumentation, Data Visualization and Communication" module, are required to take this module during their sixth semester. Students who remain on campus are free to take the Argumentation, Data Visualization and Communication module in person in either the fifth or sixth semester as they prefer.

2.3.3 German Language and Humanities Modules

German language abilities foster students' intercultural awareness and enhance their employability in their host country. They are also beneficial for securing mandatory internships (between the 2nd and 3rd year) in German companies and academic institutions. Constructor University supports its students in acquiring basic German skills in the first year of the CONSTRUCTOR Track. Non-native speaking students on campus are encouraged to take 2 German modules (2.5 CP each) but are not obliged to do so. Native Germans as well as online students (and on campus students who decide against German) do have alternative modules in Humanities in each of the first two semesters:

- Humanities Module: Introduction to Philosophical Ethics (me, 2.5 CP)
- Humanities Module: Introduction to the Philosophy of Science (me, 2.5 CP)
- Humanities Module: Introduction to Visual Culture (me, 2.5 CP)

3 ECE as a Minor

ECE as minor offers the central circuitry and major descriptions of signals and their processing together with the corresponding lab experiments. This would be a perfect combination to related majors like CS, Physics, and IEM. A CS student might be interested to see algorithms and programming from the boundary conditions of a signal-processing application and signal processing hardware. For other majors, different aspects could be of importance, e.g., a biologist that has to understand signals and their measurement.

3.1 Qualification Aims

ECE as a major will offer the central concepts of linear circuits, periodic and non-periodic, time-continuous and time-discrete deterministic signals, and all linear transforms of signals. In the labs, simple circuits will be built and measured and finally digital signal processors will be programmed for signal processing tasks.

3.1.1 Intended Learning Outcomes

With a minor in ECE, students will be able to

1. describe typical electronic components and their standard base circuits and implement analog circuitry;
2. describe the underlying theoretical concepts of deterministic signals in time and frequency domain;
3. explain and implement signal processing components, methods, and algorithms, having studied the theoretical foundation and having learned to program signal processor platforms;
4. treat signals with dedicated algorithms, be it audio, video, or from other origin, e.g., by filtering, prediction, compression.

3.2 Module Requirements

A minor in ECE requires 30 CP. The default option to obtain a minor in ECE is marked in the Study and Examination Plans in Chapter 6. It includes the following CHOICE and CORE modules:

- CHOICE Module: General Electrical Engineering I (m, 7.5 CP)
- CHOICE Module: General Electrical Engineering II (m, 7.5 CP)
- CORE Module: Signals and Systems (m, 7.5 CP)
- CORE Module: Digital Signal Processing (m, 7.5 CP)

3.3 Degree

After successful completion, the minor in ECE will be listed on the final transcript under PROGRAM OF STUDY and BA/BSc – [name of the major] as “(Minor: ECE)”.

4 ECE Undergraduate Program Regulations

4.1 Scope of these Regulations

The regulations in this handbook are valid for all students who entered the ECE undergraduate program at Constructor University in Fall 2025. In case of conflict between the regulations in this handbook and the general policies for Bachelor Studies, the latter apply (see [Academic Policies | Constructor University](#)).

In exceptional cases, certain necessary deviations from the regulations of this study handbook might occur during the course of study (e.g., change of the semester sequence, assessment type, or the teaching mode of courses).

Updates to Study Program Handbooks are based on the policies approved by the Academic Senate on substantial and nonsubstantial changes to study programs. Students are integrated in the decision-making process through their respective committee representatives. All students affected by the changes will be properly informed.

In general, Constructor University therefore reserves the right to change or modify the regulations of the program handbook also after its publication at any time and in its sole discretion.

4.2 Degree

Upon successful completion of the study program, students are awarded a Bachelor of Science degree in Electrical and Computer Engineering.

4.3 Graduation Requirements

In order to graduate, students need to obtain 180 CP. In addition, the following graduation requirements apply:

Students need to complete all mandatory components of the program as indicated in the mandatory study and examination in Chapter 6 of this handbook.

5 Schematic Study Plan for ECE

Figure 2 shows schematically the sequence and types of modules required for the study program. A more detailed description, including the assessment types, is given in the Study and Examination Plans in the following section.

ONSTRUCTOR UNIVERSITY							
Electrical and Computer Engineering (180 CP)							
CHOICE / CORE / CAREER					CONSTRUCTOR Track 45 CP		
3 x 45 = 135 CP							
3rd Year	Bachelor Thesis / Seminar m, 15 CP			Summer Internship / Start-Up (after 2 nd year) m, 15 CP		Argumentation, Data Visualization and Communication** m, 5 CP	Agency, Leadership & Accountability OR Community Impact Project me, 5 CP

¹ Status (m = mandatory, me = mandatory elective)

² For a full listing of all CHOICE / CORE / CAREER / Constructor Track modules please consult the CampusNet online catalogue and /or the study program handbooks.

³ German native speakers will have alternatives to the language courses (in the field of Humanities).

⁴ Note that 15 CP specialization modules need to be taken, of which a minimum of 10 CP must be major-specific and max. 5 CP can be major-related

Figure 3: Schematic Study and Examination Plan

7 Electrical and Computer Engineering Modules

7.1 General Electrical Engineering I

Module Name	General Electrical Engineering I
Module Code	2025-CH-210
Module ECTS	7.5
Study Semester	Mandatory status for: - 2025-RIS-BSc 1 - 2025-ECE-BSc 1 Mandatory Elective status for: None
Duration	1 Semester
Program Affiliation	2025-ECE-BSc (Electrical and Computer Engineering)
Module Coordinator(s)	Prof. Dr. Giuseppe Abreu

Forms of Learning and Teaching	
Independent Study	127
Laboratory	25.5
Lecture	35
Workload Hours	187.5 hours

Module Components	Number	Type	CP
General Electrical Engineering Lab I	CH-210-B	Laboratory	2.5
General Electrical Engineering I	CH-210-A	Lecture	5

Module Description

The module, consisting of a lecture, supported by corresponding lab experiments, comprises the classical introduction to Electrical and Computer Engineering (ECE), starting from the basics of the electric phenomenon, its fundamental elements (charge, current, potential, energy, etc.), its interaction with materials (conductivity, capacitance, inductance, etc.) and its manipulation by man-made structures (electronic components and circuits). The module then develops into a wide set of general principles, laws and analytical tools to understand electric circuits and electric systems in general.

The module also offers a solid foundation on which specialization areas in EE (e.g. Communications, Control, etc.) are built. The emphasis is the analysis of circuits in DC steady state and transient modes. Classic material include (but are not limited to): Kirchhoff's Laws, Volta's Law (capacitance), Faraday's Law (inductance), Thevenin and Norton's Theorem, Tellegen's Theorem, delta-wye transformation, source transformations, basics of non-linear electronic components (diodes and transistors), OpAmp

circuits, State-space Method, Laplace Transform applied to the analysis of higher-order circuits, Laplace impedances and transfer functions. In the lab portion of the module, users will familiarize themselves with electronic components (resistors, capacitors, inductors, diodes, OpAmps, transistors, etc.) and circuits, and learn how to utilize typical lab equipment (such as breadboards, digital multimeters, voltage and current sources and function generators) required for the assembly and analysis of electric circuits.

Recommended Knowledge

- It is highly recommended that students familiarize themselves with the contents of the appendices of a typical introductory textbook on Electrical Engineering (e.g. "Fundamentals of Electric Circuits", by Alexander and Sadiku and "Basic Engineering Circuit Analysis", by Irwin and Nelms), including Complex Numbers and basic Linear Algebra (in particular the solution of simultaneous linear equations). In addition, it is recommended that students acquire Calculus basics (differentiation and integration of simple functions).

- Basic mathematics, including notions of vectors, matrices functions, and complex numbers

Intended Learning Outcomes

No	Competence	ILO
1	Describe	Describe the fundamental physical principles of electric quantities (charge, current, potential, energy and its conservation, etc.).
2	Explain	Explain how the aforementioned quantities relate to each other and interact with matter, including corresponding mathematical models.
3	Explain	Explain how the aforementioned models can be utilized to manipulate electric quantities and phenomenon in the form of electric and electronic circuits or machines that perform several tasks and functions according to intended designs.
4	Employ	Employ various theoretical and practical tools to analyze electric circuits including resistive circuits, reactive circuits, and OpAmp circuits, both in DC steady-state and transient modes.
5		In addition to the aforementioned outcomes, fundamental to a career in ECE, students will also have acquired: analytical and mathematical modeling skills useful to study other physical systems (e.g. in other areas of Engineering, Physics, Robotics, etc.).
6		The ability to work in a lab environment and operate lab equipment, as required in other professions (e.g. Physics, Biology, Chemistry etc.).

Workload Hours	187.5 hours

Module Components	Number	Type	CP
General Electrical Engineering Lab II	CH-211-B	Laboratory	2.5
General Electrical Engineering II	CH-211-A	Lecture	5

Module Description

This module continues with the classical introduction to Electrical and Computer Engineering (ECE), developing beyond the contents introduced in CH10-GenEE11, towards building the foundations upon which modern specialization areas in ECE such as Signal Processing, Communications, and Control are based. We start with the concepts of Impedance and Phasors, followed by the introduction of the Fourier Trigonometric and Exponential Series, and later, the Fourier Transform. Using these tools as a basis, we revise various elementary circuits first studied in CH10-GenEE1 under the Laplace framework, this time emphasizing the notions of frequency (oscillation rate) and phase (rotation), thus establishing the fundamental concepts required to understand Signals and Systems, and Digital Signal Processing, to be studied in the second year. Besides the already mentioned fundamental tools of Fourier analysis, some of the classical material covered in the module include, but is not limited to: Impedances and Phasors (in the frequency domain), the Parseval Theorem (in the context of power analysis), magnetic coupling, Bode plots (in amplitude and phase), spectral graphs, the Convolution Integral and more.

Recommended Knowledge

- Review Basic mathematics, including notions of Calculus and Linear Algebra.
- Basic mathematics, including notions of Calculus and Linear Algebra

Intended Learning Outcomes

No	Competence	ILO
1	Explain	Explain the fundamental physical principle of oscillation and its frequency representation, in particular in the context of AC circuits.
2	Explain	Explain how to mathematically model the oscillatory (or periodic) phenomena in the frequency domain, in light of Fourier Analysis.
3	Explain	Explain how the latter Fourier tool extends beyond periodic phenomena, building the basic framework of general spectral analysis of physical systems, with emphasis on electric systems and signals.
4	Design	Design and analyze electronic circuits and their signals (e.g. time-varying voltages and currents) requiring certain tasks and functions according to intended objectives.
5	Analytical	Analytical and mathematical modeling skills useful to study other physical systems (e.g. in other areas of Engineering, Physics, Robotics, etc.).
6	Ability	Ability to work in a lab environment and operate lab equipment, as required in other professions (e.g. Physics, Biology, Chemistry etc.).

Independent Study	115
Workload Hours	187 hours

Module Components	Number	Type	CP
Programming in C and C++ - Tutorial	CH-230-B	Tutorial	2.5
Programming in C and C++	CH-230-A	Lecture	5

Module Description

This course offers an introduction to programming using the programming languages C and C++. After a short overview of the program development cycle (editing, preprocessing, compiling, linking, executing), the module presents the basics of C programming. Fundamental imperative programming concepts such as variables, loops, and function calls are introduced in a hands-on manner. Afterwards, basic data structures such as multidimensional arrays, structures, and pointers are introduced and dynamically allocated multidimensional arrays and linked lists and trees are used for solving simple practical problems. The relationships between pointers and arrays, pointers and structures, and pointers and functions are described, and they are illustrated using examples that also introduce recursive functions, file handling, and dynamic memory allocation.

The module then introduces basic concepts of object-oriented programming languages using the programming language C++ in a hands-on manner. Concepts such as classes and objects, data abstractions, and information hiding are introduced. C++ mechanisms for defining and using objects, methods, and operators are introduced and the relevance of constructors, copy constructors, and destructors for dynamically created objects is explained. Finally, concepts such as inheritance,

polymorphism, virtual functions, and overloading are introduced. The learned concepts are applied by solving programming problems.

Recommended Knowledge

It is recommended that students install a suitable programming environment on their notebooks. It is recommended to install a Linux system such as Ubuntu, which comes with open-source compilers such as gcc and g++ and editors such as vim or emacs. Alternatively, the open-source Code: Blocks integrated development environment can be installed to solve programming problems

Usability and Relationship to other Modules

This module introduces the programming languages C and C++ and several other modules build on this foundation. Certain features of C++ such as templates and generic data structures and an overview of the standard template library will be covered in the Algorithms and Data Structures module.

Intended Learning Outcomes

No	Competence	ILO
1	Explain	Explain basic concepts of imperative programming languages such as variables, assignments, loops, and function calls.
2	Write	Write, test, and debug programs in the procedural programming language C using basic C library functions.
3	Demonstrate	Demonstrate how to use pointers to create dynamically allocated data structures such as linked lists.
4	Explain	Explain the relationship between pointers and arrays.
5	Illustrate	Illustrate basic object-oriented programming concepts such as objects, classes, information hiding, and inheritance.
6	Give	Give original examples of function and operator overloading and polymorphism.
7	Write	Write, test, and debug programs in the object-oriented programming language C++.

Classical Physics	CH-140-A	Lecture	5

Module Description

A. This module introduces students to basic physical principles, facts, and experimental evidence in the fields of classical mechanics, thermodynamics, and optics. It lays the foundations for more advanced physics modules and for other science and engineering disciplines. It is intended for students who already have reasonably solid knowledge of basic physics and mathematics at the high school level.

B. Emphasis is placed on general physical principles and general mathematical concepts for a thorough understanding of physical phenomena. Calculus and vector analysis will be used to develop a scientifically sound description of physical phenomena. An optional tutorial is offered to discuss homework or topics of interest in more detail.

C. Topics covered in the module include an introduction to mechanics using calculus, vectors, and coordinate systems; concepts of force and energy, momentum and rotational motion, and gravitation and oscillations; and concepts of thermodynamics such as temperature, heat, ideal gas, and kinetic gas theory up to heat engines and entropy. The module content concludes with an introduction to classical optics including refraction and reflection, lenses and optical instruments, waves, interference, and diffraction.

D. The lectures are complemented by hands-on work in a teaching lab where students apply their theoretical knowledge by performing experiments as well as related data analysis and result presentation. The default lab of this module is the Classical Physics Lab offering experiments in mechanics, thermodynamics, and optics. For students majoring in RIS a Technical Mechanics Lab is offered with a focus on technical mechanics experiments.

Recommended Knowledge

- A revision of high school math (especially calculus, analytic geometry, and vector algebra) and high school physics (basics of motion, forces, and energy) is recommended. The level and content follow standard textbooks for calculus-based first-year university physics such as Young & Freedman: University Physics, Halliday & Resnick & Walker: Fundamentals of Physics, or Tipler & Mosca: Physics.

- High school physics

- High school math

Intended Learning Outcomes

No	Competence	ILO
1	Recall	Recall basic facts and experimental evidence in classical mechanics, thermodynamics, and optics.
2	Understand	Understand the basic concepts of motion, force, energy, oscillations, heat, and light and apply them to physical phenomena.
3	Describe	Describe and understand natural and technical phenomena in mechanics, thermodynamics, and optics by reducing them to their basic physical principles.
4	Apply	Apply basic calculus and vector analysis to describe physical systems.
5	Examine	Examine basic physical problems, find possible solutions, and assess them critically.
6	Set	Set up experiments, analyze their outcomes by using error analysis, and present them properly.
7	Record	Record experimental data using basic experimental techniques and data acquisition tools.
8	Use	Use the appropriate format and language to describe and communicate the outcomes of experiments and the solutions to theoretical problems.

Indicative Literature

Module Achievements: A bonus achievement for the lecture module component is offered.

7.5 Digital Systems and Computer Architecture

Module Name	Digital Systems and Computer Architecture
Module Code	2025-CH-234
Module ECTS	7.5
Study Semester	Mandatory status for: - 2025-ECE-BSc 2 - 2025-RIS-BSc 2 - 2025-CS-BSc 2 Mandatory Elective status for: - 2025-SDT-BSc 2
Duration	1 Semester
Program Affiliation	2025-CS-BSc (Computer Science)
Module Coordinator(s)	Prof. Dr. Jürgen Schönwälder

Forms of Learning and Teaching	
Lecture	35
Tutorial	17.5
Independent Study	115
Exam Preparation	20
Workload Hours	187.5 hours

Module Components	Number	Type	CP
Digital Systems and Computer Architecture	CH-234-A	Lecture	5
Digital Systems and Computer Architecture Tutorial	CH-234-B	Tutorial	2.5

Module Description

The module introduces the essential hardware components of a digital computer system. Students will learn how useful digital circuits to add numbers or to store data can be constructed out of basic logic gates. Using these building blocks, the module will introduce how a simple processor can be constructed and how it interacts with memory systems and other components of a computer system. Students will practice the basics of assembler programming to understand program execution at the hardware level.

Usability and Relationship to other Modules

This module introduces students to the digital hardware components of a computer system. Students attain an

understanding of program execution at the hardware level. Other modules requiring an understanding of program execution at the hardware level may require this module as a prerequisite.

Intended Learning Outcomes

No	Competence	ILO
1	Understand	Understand the architecture of a digital computer.
2	Explain	Explain the representation of numbers (integers and floats).
3	Summarize	Summarize basic laws of Boolean algebra.
4	Describe	Describe basic logic gates and which Boolean functions they implement.
5	Construct	Construct and analyze basic combinational digital circuits (e.g., adder, comparator, multiplexer).
6	Design	Design and analyze basic sequential digital circuits (e.g., latches, flip-flops).
7	Outline	Outline the basic structure of the von Neumann computer architecture.
8	Explain	Explain the execution of machine instructions on a von Neumann computer.
9	Develop	Develop simple programs in an assembler language such as the RISC-V.
10	Demonstrate	Demonstrate how function calls are executed and the role of the stack.
11	Understand	Understand microarchitectural concepts and the importance of the memory hierarchy.
12	Explain	Explain the purpose and principles of operation of the components of a computer system.

Module Description

CH-212-A: Electronics Foundations

Electronics have had an enormous influence on the development of modern society. Electronic devices and circuits have become essential and ubiquitous parts of our everyday lives, enabled by an industry that has pursued a relentless reduction in cost per function for over 60 years. Today's devices contain billions of transistors interconnected by kilometers of "wires," yet all fitting in a fingernail-sized integrated circuit. This course is the first course on electronic devices and circuits for undergraduate electrical and computer engineering program. It provides a foundation for understanding the materials that will be offered in core module of electronics. It builds on the General Electrical Engineering modules and provides a background for understanding linear and nonlinear electronic circuits. After a recap on linear circuits techniques, the lecture introduces fundamental nonlinear electronic devices, and electronic circuits. Starting from semiconductor properties, the operation principles and various applications of diodes and bipolar junction transistors (BJTs) are discussed. Different electronic circuits are analyzed and designed including rectifiers, voltage doublers, single-stage amplifiers, and operational amplifier (OpAmp) stages. While this lecture emphasizes theoretical concepts, the lab in

the following semester provides practical experience and allows the students to relate concrete hardware to device and circuit models. LTSpice is used for the simulation of the basic components and circuits.

The topics are:

1. An introduction to electronic industry
2. Semiconductor material and doping
3. The pn-junction physics
4. Diode I-V characteristic and reverse breakdown
5. PN-junction as a diode
6. Different applications of diodes
7. Structure of bipolar junction transistor (BJT) and its operation
8. Bipolar transistor: DC model
9. Bipolar transistor: small signal model
10. Operating point analysis and design
11. Bipolar amplifier topologies

CH-212-B: Mathematical Foundations of Communications

This course provides a foundation of the theory and applications of probability and an understanding of the mathematical techniques relating to random processes in the areas of signal processing, detection, estimation, and communication. Topics include the axioms of probability, random variables, density and distribution functions, transformations of random variables, random vectors and processes. Also, first and second moments in particular mean functions and autocorrelation functions will be discussed as a practical approach to characterize wide sense stationary processes.

The topics are:

1. Introduction and Frequency-Based Probability
2. Outcomes, Events & Sample Space, Axioms
3. Bayes, Partitions
4. Binomials & Poisson-Approximation, Normal Approximation
5. Random Variables (RVs), Distribution Functions, Density Functions
6. Two and More RVs, Independence
7. Conditional Distributions and Densities
8. Transformations 1-dim
9. Transformations 2-dim
10. Expected Values & Moments, Covariance
11. Random Vectors & Moments, COV-Matrix with Properties
12. Multidim. Normals
13. Random Processes, Mean- & Autocorrelation Functions, Wide Sense Stationarity
14. Reserve & Wrap-up Session

CH-212-C: MATLAB - Tutorial

MATLAB (matrix laboratory) is a high-level programming language and interactive environment for numerical computation, visualization and programming which is widely used in the research areas of Signal Processing, Communications, Control Theory. This lab aims to give tutorials for beginners to

understand basic to advanced functionality of MATLAB. After completing this tutorial, you will learn MATLAB as a tool to solve various mathematical problems, plot data and import/output data with external files. Basic Simulink toolboxes for Communications and Control will also be introduced.

Recommended Knowledge

- Revise linear circuits from your 1st year and get textbooks & lab material. See dedicated module Web pages for details (links on CampusNet).
- Linear circuits
- Basic Calculus
- Basic Linear Algebra

Usability and Relationship to other Modules

- Mandatory for major in ECE
- CH-212-A builds on the GenEE1 and GenEE2 modules and prepares the students for core course in the second year and practical specializations in their 3rd year.
- CH-212-B Provides foundations for the Communications Basics and Wireless Communication modules.

Intended Learning Outcomes

No	Competence	ILO
1	CH-212-A:	CH-212-A: Electronics Foundations:
2	Explain	Explain fundamentals of diode and bipolar transistor.
3	Analyze	Analyze and design electronic circuits, in particular linear networks, amplifiers, and operational amplifier circuits, based on diodes and bipolar transistors.
4	Compare	Compare different designs regarding their performance figures like voltage gain, current gain, bandwidth, input impedance and output impedance.
5	CH-212-B:	CH-212-B: Mathematical Foundations of Communications:
6	Students	Students understand and can apply probability axioms and the frequency-based probability concept.
7	They	They can apply the concepts of random variables including their (joint) distribution and density functions.
8	They	They can find distributions and densities of transformed random variables.
9	Students	Students can calculate and use expected values, in particular moments, in order to characterize random variables and random processes.
10	They	They understand and are able to handle covariance matrices and multi-dimensional Normals.
11	CH-212-C:	CH-212-C: MATLAB - Tutorial
12	Understand	Understand basic to advanced functionality of MATLAB.

13	Solve	Solve various mathematical problems by MATLAB.
14	Plot	Plot, import/output data by MATLAB.
15	Be	Be able to use Communications and Control Simulink Toolboxes.

7.7 Signals and Systems

Module Name	Signals and Systems
Module Code	2025-CO-520
Module ECTS	7.5
Study Semester	Mandatory status for: - 2025-ECE-BSc 3 Mandatory Elective status for: None
Duration	1 Semester
Program Affiliation	2025-ECE-BSc (Electrical and Computer Engineering)
Module Coordinator(s)	Prof. Dr.-Ing. Mojtaba Joodaki

Forms of Learning and Teaching	
Independent Study	127
Laboratory	25.5
Lecture	35
Workload Hours	187.5 hours

Module Components	Number	Type	CP
Signals and Systems - Lab	CO-520-B	Laboratory	2.5
Signals and Systems	CO-520-A	Lecture	5

Module Description

This module offers a comprehensive exploration of signals and systems which is the key knowledge for almost all electrical engineering tasks. Continuous-time and discrete-time concepts/methods are developed in parallel, highlighting their similarities and differences. Central is the coverage of all linear transforms.

Introductory treatments of the applications of these basic methods in such areas as filtering, communication, sampling, discrete-time processing of continuous-time signals, and feedback, will be discussed. We are also covering stability, minimum and maximum phase, delay, group delay and characteristic impedance of two-ports to build cascades of filter blocks. The module contains also a short treatment of analog modulation methods, such as amplitude, single-sideband and vestigial-sideband, frequency, and phase modulation.

The practical lab contains experiments addressing transient and frequency response with some RLC circuits, Fourier series and transform, sampling, AM and FM modulation.

Recommended Knowledge

Revise linear circuits and transforms and Matlab from your 1st year, and get textbook & lab material. See dedicated Module Web pages for details (links on CampusNet).

Usability and Relationship to other Modules

This module builds on the GenEE1 and GenEE2 modules and prepares the students for advanced modules in their 2nd & 3rd year

Intended Learning Outcomes

No	Competence	ILO
1	Explain	Explain all linear transforms with all their properties and the links between them.
2	Apply	Apply linear transforms to time-continuous and time-discrete problems.
3	Describe	Describe the function of poles and zeros, and the meaning of stability, minimum phase, delay and group delay functions.
4	Describe	Describe the link between pole and zero locations and the resulting transfer function.
5	Apply	Apply the major concepts of the module (such as time and frequency-domain, sampling, and analog modulation) to practical problems using function generators, digital scopes, and Matlab.

7.8 Digital Signal Processing

Module Name	Digital Signal Processing
Module Code	2025-CO-521
Module ECTS	7.5
Study Semester	Mandatory status for: - 2025-ECE-BSc 4 Mandatory Elective status for: None
Duration	1 Semester
Program Affiliation	2025-ECE-BSc (Electrical and Computer Engineering)
Module Coordinator(s)	Prof. Dr.-Ing. Mojtaba Joodaki

Forms of Learning and Teaching	
Independent Study (For Laboratory)	38.5
Independent Study (For Lecture)	90
Laboratory	24
Lecture	35
Workload Hours	187.5 hours

Module Components	Number	Type	CP
Digital Signal Processing Lab	CO-521-B	Laboratory	2.5
Digital Signal Processing	CO-521-A	Lecture	5

Module Description

The module is a combination of standard Digital Signal Processing (DSP) contents and applications in digital communications. The standard DSP contents are linear transforms, sampling theorem, quantization, networks with delay elements, difference equations, filter structures (implementations in C/Matlab), z-transform, frequency-domain characterization (Parseval), DFT, window functions, frequency response of frequency-selective filters, fast convolution (overlap save, overlap add), power spectral density, periodogram, design of poles and zeros, least squares identification and prediction (LPC, Toeplitz algorithms), design of digital filters (short introduction to wave digital filters), sampling rate conversion, subband coding, FFT algorithms, quadrature mirror filters, filter banks, two-dimensional transforms, discrete cosine transform, (wavelets) and an introduction to video coding. The communications part is essentially an introduction to digital communications with channel properties, passband and complex baseband description, PAM, QAM, matched filter, whitened matched filter, equalizer structures and its adaptation with LMS and ZF. An introduction to multicarrier transmission (OFDM, DMT) and the relation to filter banks will be given, too. OFDM and DMT are the transmission methods used in every current wireless and wireline system (LTE, DSL, DVB-t, etc.). Overall, the module provides a complete coverage of digital signal processing and the essential basics of digital communications. The module is hence mandatory for ECE and central for students with a focus towards signal processing, video and audio, and communications.

This lab component compliments the lecture by providing hands-on experience in practical development of a communications system using Digital Signal Processors. Note that although the focus is on DSP in this module, many of the concepts learned also apply to embedded development, which is also becoming increasingly important in our electronic world.

Recommended Knowledge

- Revise linear transforms, especially Laplace transforms, get textbook & lab material. See dedicated module Web pages for details (links on CampusNet).
- Signal description with linear transforms,
- Linear circuits and their description with linear transforms
- Familiarity with bilateral and unilateral Laplace transforms
- Matlab and C programming

Usability and Relationship to other Modules

- Important basis for all advanced modules in Signal Processing and Communications.
- Wireless Communication (CO-523) together with DSP and the earlier introductory Communications Basics module (CO-522) will provide a wide coverage of analog and digital communications methods.
- In Coding Theory (CA-ECE-802), some interesting links will become visible, e.g., using convolution in so-called convolutional codes, other conceptually similar Toeplitz algorithm, the DFT to define Reed-Solomon codes.
- The Module Control Systems (CO-545 / RIS) is a nice counterpart of Signals and Systems plus Digital Signal Processing, especially, adding aspects of stability from a different angle.
- Mandatory for a major and minor in ECE.

Intended Learning Outcomes

No	Competence	ILO
1	Model	Model and analyze signals mathematically, enable their manipulation (filtering, recovery, sampling, etc.) and design various engineering applications.
2	Apply	Apply digital signal processing methods to speech, audio, and video signal processing, automation, and control systems.
3	Understand	Understand all major digital communications methods, be it baseband, single-carrier, multi-carrier, or spread spectrum.
4	Understand	Understand the essential components of a transmission chain from the transmitter to detection at a receiver, including multiple-input and multiple-output systems.
5	Implement	Implement digital signal processing and digital communications methods.
6	Be	Be familiar with digital signal processors.

Workload Hours	125 hours

Module Components	Number	Type	CP
Communications Basics Lab	CO-522-B	Laboratory	2.5
Communications Basics	CO-522-A	Lecture	2.5

Module Description

The module comprises the basis for analog and digital communication, and prepares the students for more advanced modules on wireless communication and information theory. Starting from first steps to understand modulation and demodulation procedures with and without noise, students will learn the basics of binary data transmission. The lab course provides hands-on experience with practical development of a communications system using Simulink and Matlab simulations. This includes the design and the implementation of the typical building blocks of a digital transmitter and receiver chain. Topics covered are: BPSK, QPSK, pulse shape, up-conversion, matched filter, PLL, carrier recovery, symbol timing recovery, and demodulation.

Recommended Knowledge

- Revise linear transforms and Matlab from your 1st year, and get textbook & lab material. See dedicated module Web pages for details (links on CampusNet).
- Linear Transforms (Fourier)
- Matlab

Usability and Relationship to other Modules

This module builds on the Gen EE I+II modules and prepares the students for advanced modules in their 2nd & 3rd year

Intended Learning Outcomes

No	Competence	ILO
1	Explain	Explain fundamental blocks of a communication chain.
2	Model	Model the blocks based on Matlab and Simulink.
3	Characterize	Characterize wide sense stationary random (noise) processes and their transformation by LTI systems.
4	Analyze	Analyze and design basic linear and nonlinear modulation and demodulation blocks.
5	Analytically	Analytically compare different designs with regard to their performance figures like required bandwidth and signal-to-noise ratio.
6	Numerically	Numerically evaluate performance figures of simulated communication chains.

Forms of Learning and Teaching	
Independent Study	90
Lecture	35
Workload Hours	125 hours

Module Components	Number	Type	CP
Wireless Communication I	CO-523-A	Lecture	5

Module Description

This module builds upon the knowledge gained in Signals and Systems, Electromagnetics, and Communications, developing those further into the set of required tools to analyze and design wireless communications systems. Starting from notions of propagating waves learned in Electromagnetics, and relying on tools studied in Probability, the dedicated theory to mathematically model the various complex phenomena undergone by signals as they propagate in an open medium (e.g. vacuum, air, or water) is described. Within such a theory, the various forms of distortion and impairments suffered by wireless signals, including, e.g., noise, propagation losses, polarization, spectral and temporal dispersion, selectivity and fading, as well as interference are studied, and techniques to engineer signals so as to withstand such hindrances while retaining the ability to convey information are described. Overall, the focus is on classical narrowband point-to-point wireless communications, but occasional incursions into modern methods such as multiple-input multiple-output (MIMO) systems and ultra-wideband communications (UWB) - to cite only a few - are also made. Topics covered include, but are not limited to, statistical characterization of fading (Rayleigh, Rice, Hoyt, and Nakagami) channels, coherent and differential digital modulation, pairwise, symbol and bit-error probabilities, water-filling transmit power optimization, and more. In the process, several tools including probability bounds (e.g. the union bound, Gaussian Q-functions, Chernoff, Chebychev, and Bonferroni bounds) and optimization methods (e.g. Lagrange Multiplier Method, Maximum Ratio Combining, Kullback Leibler Divergence minimization, and Maximum-Entropy Methods) are also introduced, which are useful not only to Wireless Communications, but to the analysis and design of virtually any system afflicted by uncertainties.

Recommended Knowledge

It is recommended that students are in good standing with respect to the listed pre-requisite modules and are capable of writing simple programs, as well as to perform basic operations, in Matlab.

Intended Learning Outcomes

No	Competence	ILO
1	Explain	Explain the physical nature of, and the corresponding mathematical/statistical models suitable to describe, the fundamental phenomena afflicting wireless signals.
2	Describe	Describe qualitatively, and quantify statistically, the effects of the aforementioned phenomena on the ability to convey information over various kinds of wireless channels.
3	Perform	Perform essential design steps for modern wireless communications systems taking into account the aforementioned properties and phenomena of wireless communication.
4	In	In addition to the aforementioned outcomes, fundamental to a career in ECE, students will also have acquired: analytical and mathematical tools useful to study various systems in which statistical uncertainty plays a major role, examples of which are hypothesis testing methods widely used in experimental sciences (also, e.g., in Biology and Psychology).

Forms of Learning and Teaching	
Independent Study	90
Lecture	35
Workload Hours	125 hours

Module Components	Number	Type	CP
Electromagnetics	CO-524-A	Lecture	5

Module Description

Unlike other engineering disciplines, the complete theory of electrical engineering can be summarized in four fundamental equations known as Maxwell's equations. This module gives an introduction to the electric and magnetic field theory, leading to Maxwell's equations. The theory is applied to wave propagation problems and guided waves on transmission lines. This knowledge enables us to understand the physics behind electrical signals travelling through lines and electronic devices.

Contents:

- Electric Field: Electric charge, charge distributions, Coulomb's law, electric field, dipoles, electric flux, Gauss' law, potential, capacitance;
- Currents: current density, conductance, superconductors, semiconductors;
- Magnetic Field: magnetic force, magnetic flux, Ampere's law, inductance, Faraday's law, Lenz' law, displacement

current, boundary conditions

- Electromagnetic Waves: Maxwell's equations, electromagnetic waves, radiation, waves on transmission lines.

Recommended Knowledge

- Students should come with a sound understanding of electromagnetic fields and elementary passive components.
- Basic knowledge of electrical and magnetical fields
- Description of resistor, capacitor, inductor

Usability and Relationship to other Modules

The module conveys basic knowledge for the lab “PCB design and measurement automation” and for RF-oriented specialization modules.

Intended Learning Outcomes

No	Competence	ILO
1	Apply	Apply Maxwell's equations in integral and differential form.
2	Use	Use vector operators grad, div, curl.
3	Compute	Compute capacity and inductance for given geometries using symmetries and possibly coordinate transformations.
4	Explain	Explain and apply the principle of waves on wave guides (cables and hollow wave guides) and emitted from dipole antennas.

Forms of Learning and Teaching	
Independent Study	90
Lecture	35
Workload Hours	125 hours

Module Components	Number	Type	CP
Information Theory	CO-525-A	Lecture	5

Module Description

Information theory serves as the most important foundation for communication systems. The module provides an analytical framework for modeling and evaluating point-to-point and multi-point communication. After a short rehearsal of probability and random variables and some excursion to random number generation, the key concept of information content of a signal source and information capacity of a transmission medium are precisely defined, and their relationships to data compression algorithms and error control codes are examined in detail. The module aims to install an appreciation for the fundamental capabilities and limitations of information transmission schemes and to provide the mathematical tools for applying these ideas to a broad class of communications systems.

The module contains also a coverage of different source-coding algorithms like Huffman, Lempel-Ziv-(Welch), Shannon-Fano-Elias, Arithmetic Coding, Runlength Encoding, Move-to-Front transform, PPM, and Context Tree Weighting. In Channel coding, finite fields, some basic block and convolutional codes, and the concept of iterative decoding will be introduced. Aside from source and channel aspects, an introduction to security is given, including public-key cryptography. Information theory is a standard module in every communications-oriented Bachelor's program.

Recommended Knowledge

- Signals and Systems contents, such as DFT and convolution

- Notion of probability, combinatorics basics as taught in Methods module "Probability and Random Processes"

- Some basic knowledge of communications and sound understanding of probability is recommended. Hence, it is strongly advised to take the methods and skills course Probability and Random Processes prior to this module. Nevertheless, probability basics will also be revised within the module.

Usability and Relationship to other Modules

- Although not a mandatory prerequisite, this module is ideally taken before Coding Theory (CA-ECE-802)

- All communications-related modules are naturally based on information theory

- Students from Computer Science or related programs, also students taking Bio-informatics modules, profit from information-theoretic knowledge and source coding (compression) algorithms. Students from Computer Science would also be interested in the algebraic basics for error-correcting codes and cryptography, fields which area also introduced shortly.

- Serves as a mandatory elective 3rd year Specialization module for CS and RIS major students.

Intended Learning Outcomes

No	Competence	ILO
1	Explain	Explain what is understood as the information content of data and the corresponding limits of data compression algorithms.
2	Design	Design and apply fundamental algorithms in data compression.
3	Explain	Explain the information theoretic limits of data transmission.
4	Apply	Apply the mathematical basics of channel coding and cryptography.
5	Implement	Implement some channel coding schemes.
6	Differentiate	Differentiate the principles of encryption and authentication schemes and implement discussed procedures.

7.13 Electronics

Module Name	Electronics
Module Code	2025-CO-526
Module ECTS	5
Study Semester	Mandatory status for: - 2025-ECE-BSc 3 Mandatory Elective status for: - 2025-PHDS-BSc 3
Duration	1 Semester
Program Affiliation	2025-ECE-BSc (Electrical and Computer Engineering)
Module Coordinator(s)	Prof. Dr. -Ing. Mojtaba Joodaki

Forms of Learning and Teaching	
Independent Study	82
Laboratory	25.5
Lecture	17.5
Workload Hours	125 hours

Module Components	Number	Type	CP
Electronics Lab	CO-526-B	Laboratory	2.5
Electronics	CO-526-A	Lecture	2.5

Module Description

This module (the course and the lab) together with the course of Foundations of Electronics in the previous semester includes the most fundamental and essential topics for the study of electronic devices and circuits. The lecture part starts with MOSFET (metal oxide field effect transistor) structure and operation, MOSFET DC model, MOSFET small signal model and MOSFET amplifier topologies. Then differential and multistage amplifiers and feedback circuits will be covered. Finally, frequency response of electronic circuits and some examples of operational-amplifier (Op-Amp) circuits applications will be discussed.

While the lecture emphasizes theoretical concepts, the lab provides practical experience and allows the students to relate concrete hardware to device and circuit models. LTSpice is used for the simulation of the basic components and circuits. Experiments include RLC circuits, filters and resonators, diodes, pn-junctions and their application, bipolar junction transistors (BJT) and elementary transistor circuits including amplifiers, differential amplifiers and the basics of operational amplifiers, application of operational amplifiers. MOS field effect transistors and their application in amplifiers and inverter circuits.

Recommended Knowledge

- Linear circuits

- Basic Calculus

- Basic Linear Algebra

- Revise linear circuits from your 1st year, and get textbook & lab material. See dedicated module Web pages for details (links on CampusNet).

Usability and Relationship to other Modules

- Pre-requisite for the 2nd year PCB design lab and 3rd year ECE specialization modules Embedded Systems and Digital

Design.

- This module builds on the GenEE1 and GenEE2 modules (as well as on physics CORE module Electrodynamics) and prepares the students for practical specializations in their 3rd year.

- Mandatory for major in ECE.

Intended Learning Outcomes

No	Competence	ILO
1	Explain	Explain fundamental MOSFET
2	Analyze	Analyze and design electronic circuits, in particular linear networks and amplifiers based on MOSFETs (n-MOSFET, p-MOSFET and CMOS);
3	Analyze	Analyze and design differential amplifiers, multistage amplifiers, feedback circuits, frequency response of electronic circuits and be able to implement Op-Amp circuits for different applications.
4	Operate	Operate lab equipment (oscilloscopes, electric sources, voltmeters) to investigate DC and AC circuits.

7.14 PCB Design and Measurement Automation

Module Name	PCB Design and Measurement Automation
Module Code	2025-CO-527
Module ECTS	5
Study Semester	Mandatory status for: - 2025-ECE-BSc 4 Mandatory Elective status for: - 2025-RIS-BSc 4
Duration	1 Semester
Program Affiliation	2025-ECE-BSc (Electrical and Computer Engineering)
Module Coordinator(s)	Prof. Dr.-Ing. Mojtaba Joodaki

Forms of Learning and Teaching	
Independent Study	65.5
Laboratory	59.5
Workload Hours	125 hours

Module Components	Number	Type	CP
PCB Design and Measurement Automation	CO-527-A	Laboratory	5
	CO-527-A		

Module Description

The module (lab) covers mainly two aspects that are seen to be important for employability. One share of the lab deals with measurement automation. Similar tasks, one also finds in industrial automation or monitoring, sometimes using the same tools. Students will learn to use Matlab and Labview for measurement automation tasks. In there, students will also get acquainted with more advanced measurement equipment, like high-end digital scopes, network, and spectrum analyzers. The students will measure standard telephone cables in their properties, which will require a treatment of transmission line theory and transformers/baluns. These theoretical aspects will also be covered.

The second major aspect handled in the lab makes students aware that electrical/electronic components have non-ideal behaviors, e.g., that a capacitor can act as an inductor in some frequency range. It makes students also aware of the problems in selecting the right component for a certain function inside a circuit, caring not just for the frequency range and the variation of properties with frequency, but also power, current, and voltage limits.

Then, a typical circuit design path will be taught, starting from schematics to placement of components and routing. Important aspects of printed circuit board design are treated, like how analog and digital power supplies have to be realized, how mass connections should look like, what measures have to be taken to block unwanted signal coupling is avoided, e.g., blocking capacitors, star-like power supply wiring.

Students also practice scientific writing in line with scientific writing rules as a preparation for their BSc thesis.

Recommended Knowledge

- Knowledge of Fourier series and transforms
- Basic knowledge of electronics components and circuits
- Matlab
- Download material from corresponding Web pages and get to know the tasks and how the tools and equipment works.

Usability and Relationship to other Modules

This module builds on previous electronics knowledge and rounds this knowledge up with the final PCB design. Having learned to use Matlab in earlier modules, mostly for signal processing tasks, this module shows another application and provides a view into graphical programming as another option which they have seen earlier in the form of Simulink The module prepares students for a thesis with PCB design aspects.

Intended Learning Outcomes

No	Competence	ILO
1	Use	Use vector network analyzers, spectrum analyzers, and more advanced digital scopes.
2	Learn	Learn how to program with LabVIEW.
3	Remotely	Remotely control measurement equipment using Matlab or LabVIEW.
4	Describe	Describe principles of remote control.
5	Know	Know transmission line theory and how transformers/baluns are modeled.
6	Measure	Measure and determine line parameters.
7	Taking	Taking non-ideal behavior of passive and active components into account and be able to select components according to their parameters and limitations.
8	Design	Design printed circuit boards (PCB) with typical tools and a typical design cycle consisting of schematics, placement, and routing.
9	Design	Design analog and digital power routes, shielding ground connections, use measures to block unwanted ingress and coupling.
10	Organize	Organize work contributions of group members in the lab and in reporting.
11	Write	Write reports in line with scientific writing rules as a preparation for their BSc thesis.

7.15 Wireless Communication II

Module Name	Wireless Communication II
Module Code	2025-CA-S-ECE-801
Module ECTS	5
Study Semester	Mandatory status for: None Mandatory Elective status for: - 2025-ECE-BSc 5
Duration	1 Semester
Program Affiliation	2025-ECE-BSc (Electrical and Computer Engineering)
Module Coordinator(s)	Prof. Dr. Giuseppe Abreu

Forms of Learning and Teaching	
Independent Study	90
Lecture	35
Workload Hours	125 hours

Module Components	Number	Type	CP
Wireless Communication II	CA-ECE-801	Lecture	5

Module Description

This complements the knowledge gained in Signals and Systems, Communications, and Wireless Communications I, focusing on the multi-access aspect of wireless systems. To elaborate, while Wireless Communications I is mostly concerning the fundamental technologies to design and optimize modern communications systems from a single user (point-to-point) perspective, this module focuses on techniques employed to enable multiple users to communicate simultaneously. Specifically, the module covers the mechanisms to mitigate or manage interference that arises when multiple users share the same wireless channel. Within this general theme, the 3 classical multi-access methods, namely: time division multiple access (TDMA), code division multiple access (CDMA), and orthogonal frequency division multiple access (OFDMA) are covered. As part of the latter, various mathematical tools essential to the understanding of multi-access schemes are also introduced (at the depth allowed by time), including, but not limited to: optimization theory, queueing theory, graph theory, fast-Fourier transform and more. In passing, modern technologies based on the extension or combination of the latter with multi-antenna systems (i.e. MIMO) are also touched upon. With the complementation of the preceding Wireless Communications I, the module brings the student to the level required to understand research articles on modern Wireless Communications, helping lay the foundation for a Bachelor's Thesis towards a specialization in the area.

Recommended Knowledge

- At a minimum, it is recommended that students are in good standing with respect to the contents of Signals and Systems, Communications, and Probability. In addition, it is desirable that students are capable of writing simple programs, as well as to perform basic operations, in Matlab.

- Notions of signals and systems and of digital communications

Intended Learning Outcomes

No	Competence	ILO
1	Describe	Describe the key features and principles of the three classic multi-access approaches (TDMA, CDMA, and OFDMA) for wireless systems.
2	Explain	Explain qualitatively, and quantify statistically, the effects of limitations particular to each of the aforementioned approaches (e.g. packet collision in TDMA, out-of-phase and cross-correlation in CDMA, and frequency offset and sampling mismatch in OFDMA) on the performance of multi-access wireless schemes.
3	Describe	Describe the techniques utilized to design modern wireless communications systems so as to circumvent the aforementioned effects.
4	Analytical	Analytical and mathematical tools useful to study various systems in which similar problems appear. A case in point is Markov Chains, which find applications in a wide range of sciences, including Physics, Chemistry, Computer Science, and Social Sciences.

Wireless Communication II	Written Examination	120 minutes	100	45%	All

Module Achievements: None

7.16 Coding Theory

Module Name	Coding Theory
Module Code	2025-CA-S-ECE-802
Module ECTS	5
Study Semester	Mandatory status for: None Mandatory Elective status for: - 2025-ECE-BSc 5
Duration	1 Semester
Program Affiliation	2025-ECE-BSc (Electrical and Computer Engineering)
Module Coordinator(s)	Prof. Dr.-Ing. Mojtaba Joodaki

Forms of Learning and Teaching	
Independent Study	90
Lecture	35
Workload Hours	125 hours

Module Components	Number	Type	CP
Coding Theory	CA-ECE-802	Lecture	5

Module Description

Error correcting codes (convolutional codes, block codes, Turbo codes, LDPC codes, etc.) play an essential role in modern digital high data-rate transmission systems. They are part of almost every modern communication, storage, or recording device, like a CD player, your DSL home Internet access, and your mobile phone, to name just a few. This module will focus on theory, construction, and algorithms for error correcting codes, and will highlight the application in communication systems. For modern communications, coding knowledge is a must.

Recommended Knowledge

- At a minimum, it is recommended that students are in good standing with respect to the contents of Signals and Systems, Communications and Probabilities. Information Theory is, of course, the underlying basis of Coding Theory and should have been taken, but the module will be self-contained introducing major information-theoretic concepts where needed.

- Signals and Systems contents, such as DFT and convolution

- Notion of probability, combinatorics basics

Usability and Relationship to other Modules

- All Communications modules (Communications Basics/ Communications Lab, Wireless Communications, Wireless Communications II) are naturally linked to Coding Theory.

- Digital Signal Processing (CO-521) has many links to Coding Theory

- Information Theory (CO-525) is the theoretical foundation of Coding Theory

- In some computer science programs, coding theory is considered a branch of theoretical computer science and hence, the module is also a possibly choice for computer scientists

Intended Learning Outcomes

No	Competence	ILO
1	Understand	Understand all major code classes, like convolutional, Block, Turbo, LDPC, and Polar codes, rateless coding and network coding.
2	To	To compute in finite fields, the mathematical structure used in coding and cryptology.
3	Understand	Understand the interplay between blocks of the transmission chain, especially, between modulation and coding.
4	Understand	Understand that lattices can be obtained from coding schemes.
5	Realize	Realize that information theoretic results define practical solutions, e.g., that the optimum distribution for a Gaussian channel is Gaussian as well, which is then practically obtained by Shaping methods.
6	Understand	Understand the limits of code design and application.
7	Select	Select and optimize codes for a certain application.
8	Implement	Implement coding schemes.
9	Implement	Implement encoding and decoding algorithms and evaluate code performances.

7.17 Digital Design

Module Name	Digital Design
Module Code	2025-CA-S-ECE-803
Module ECTS	5
Study Semester	Mandatory status for: None Mandatory Elective status for: - 2025-RIS-BSc 5 - 2025-CS-BSc 5 - 2025-ECE-BSc 5
Duration	1 Semester
Program Affiliation	2025-ECE-BSc (Electrical and Computer Engineering)
Module Coordinator(s)	Dr. Fangning Hu

Forms of Learning and Teaching	
Independent Study	90
Lecture/Laboratory	35
Workload Hours	125 hours

Module Components	Number	Type	CP
Digital Design	CA-ECE-803	Lecture and Laboratory	5

Module Description

The current trend of digital system design is towards hardware description languages (HDLs) that allow compact description of very complex hardware constructs. The module provides a sound introduction to basic components of a digital system such as logic gates, multiplexers, decoders, flip-flops and registers as well as VHDLs such as types, signals, sequential and concurrent statements. Methods and principle of designing complex digital systems such as finite state machines, hierarchical design, pipelined design, RTL design methodology and parameterized design will also be introduced. Students will learn VHDL for programming FPGA boards to realize small digital systems in hardware (i.e. on FPGA boards). Such digital systems could be adders, multiplexers, control units, multipliers, asynchronous serial communication modules (UART). At the end of the module, the students should be able to design a simple digital system by VHDL on an FPGA board.

Recommended Knowledge

Students may prepare themselves with books like “Brent E. Nelson, Designing Digital Systems, 2005” and “Pong P. Chu, RTL Hardware Design Using VHDL, A John Wiley & Sons, Inc, Publication, 2006”.

Usability and Relationship to other Modules

This module introduces how to design digital systems and how to realize them on a FPGA board which could also serve as a specialization module for students from Computer Science and Robotics and Intelligent Systems.

Intended Learning Outcomes

No	Competence	ILO
1	Understand	Understand the principle of digital system design based on standard building blocks and components.
2	Design	Design a complex digital system.
3	Understand	Understand the limitations of a given hardware platform (here FPGAs), modify algorithms where necessary, and structure them suitably in order to optimize performance and complexity.
4	Use	Use a typical development system.
5	Program	Program in VHDL.
6	Program	Program an FPGA board.

Module Achievements: None

7.18 Radio-Frequency (RF) Design

Module Name	Radio-Frequency (RF) Design
Module Code	2025-CA-S-ECE-804
Module ECTS	5
Study Semester	Mandatory status for: None Mandatory Elective status for: - 2025-ECE-BSc 6
Duration	1 Semester
Program Affiliation	2025-ECE-BSc (Electrical and Computer Engineering)
Module Coordinator(s)	Prof. Dr.-Ing. Mojtaba Joodaki

Forms of Learning and Teaching	
Independent Study	90
Lecture	35
Workload Hours	125 hours

Module Components	Number	Type	CP
Radio-Frequency (RF) Design	CA-ECE-804	Lecture	5

Module Description

The objective of this module is to gain an understanding of today's design process of active and passive microwave circuits. After a review of the transmission line theory and microwave-related network theory, the operational principles of basic building block of microwave circuits are discussed. Additionally, the module provides an overview of typical microwave circuit applications for modern wireless communication systems. Especially, the module will cover:

- Transmission-line theory (recap)
- Skin effect
- Network theory for microwave circuits
- Microstrip circuit design
- Smith diagram and its application
- Couplers and power splitters
- Non-reciprocal components
- Noise in microwave circuits
- Active components

Recommended Knowledge

- Student should come with a good understanding of fields and wave propagation covered in an Electromagnetics module.
- Knowledge of electric and magnetic fields
- Knowledge of wave propagation and transmission line theory

Usability and Relationship to other Modules

The module rounds up the knowledge from the earlier Electromagnetics module (CO-524) and completes the contents of the wireless communications module (CO-523) from an RF perspective.

Intended Learning Outcomes

No	Competence	ILO
1	Characterize	Characterize passive and active RF components.
2	Understand	Understand and apply RF circuit design methods.
3	Understand	Understand wave propagation.
4	Understand	Understand and design the interface between baseband signal processing and actual RF transmission.
5	Design	Design analog front-end circuitry

Additional Remarks	None

Assessment and Completion

Components	Examination Type	Duration /Length	Weight (%)	Minimum	ILOs
Radio-Frequency (RF) Design	Written Examination	120 minutes	100	45%	1-5

Module Achievements: At least 30% of the assignments given must be correctly solved to demonstrate a sufficient level of practical design skills.

7.19 Optimization

Module Name	Optimization
Module Code	2025-CA-S-RIS-803
Module ECTS	5
Study Semester	Mandatory status for: None Mandatory Elective status for: - 2025-RIS-BSc 6 - 2025-ECE-BSc 6
Duration	1 Semester
Program Affiliation	2025-RIS-BSc (Robotics and Intelligent Systems)
Module Coordinator(s)	Prof. Dr. Francesco Maurelli

Forms of Learning and Teaching	
Independent Study	90
Lecture	35
Workload Hours	125 hours

Module Components	Number	Type	CP
Optimization	CA-RIS-803	Lecture	5

Module Description

Optimization is a key step in the design of systems and processes. The course starts with a review of multidimensional calculus applied to unconstrained problems. It then focuses on equality- and inequality-constrained cases from the perspective of the Lagrange formalism and introduces the KKT theorem for convex problems. Linear and quadratic programming methods are covered as important application-oriented examples. Special emphasis is placed on duality, in particular, in the case of semidefinite programming. The last part of the course is devoted to deterministic and probabilistic search methods, introducing the ideas of genetic algorithms. The course provides a wide variety of examples, including applications in electronics, decision-making, machine learning, and optimal control.

Recommended Knowledge

Revise calculus and linear algebra from your first year.

Usability and Relationship to other Modules

This module builds on the first year Calc/LA modules and prepares the students for more challenging optimization aspects, which will be relevant in many third year projects, particularly in the fields of machine learning, robotics, control, and communication.

Intended Learning Outcomes

No	Competence	ILO
1	Apply	Apply classical search techniques.
2	Apply	Apply and understand the Lagrange formalism.
3	Phrase	Phrase optimization problems in terms of suitable standard types, and address them accordingly.
4	Solve	Solve optimization problems by means of dedicated software packages.

Lecture	17.5
Workload Hours	62.5 hours

Module Components	Number	Type	CP
Nanotechnology	CA-PHDS-806	Lecture	2.5

Module Description

The Nanotechnology Module is part of a collection of physics specialization modules that cover topics in advanced experimental physics focusing on biophysics, nanotechnology, advanced optics, and molecular physics. These modules provide an introductory overview of a range of interdisciplinary topics in experimental and computational physics for advanced physics majors. After introductions to the fields, seminal and recent research is discussed, in parts based on original literature.

The physics specialization modules aim to prepare students for their further professional, research, or academic careers in physics and related fields with lectures on important advanced topics in physics, an introduction to scientific research methods and tools, and an exposure to original scientific research literature. Lectures are complemented by homework exercises and/or student projects that culminate in student presentations, term papers or written exams depending on the specific module.

Recommended Knowledge

Basics skills in quantum mechanics

Usability and Relationship to other Modules

Possible elective for a Physics minor

Intended Learning Outcomes

No	Competence	ILO
-----------	-------------------	------------

1	Reduce	Reduce complex systems to their basic physical properties.
2	Explain	Explain phenomena in nanosystems by basic principles from physics.
3	Qualitatively	Qualitatively but mathematically describe nanosystems by their physical properties.
4	Communicate	Communicate in scientific language using advanced field-specific terms.

Workload Hours	375 hours

Module Components	Number	Type	CP
Internship	CA-INT-900-0	Internship	15

Module Description

The aims of the internship module are reflection, application, orientation, and development: for students to reflect on their interests, knowledge, skills, their role in society, the relevance of their major subject to society, to apply these skills and this knowledge in real life whilst getting practical experience, to find a professional orientation, and to develop their personality and in their career. This module supports the programs' aims of preparing students for gainful, qualified employment and the development of their personality.

The full-time internship must be related to the students' major area of study and extends lasts a minimum of two consecutive months, normally scheduled just before the 5th semester, with the internship event and submission of the internship report in the 5th semester. Upon approval by the SPC and SCS, the internship may take place at other times, such as before teaching starts in the 3rd semester or after teaching finishes in the 6th semester. The Study Program Coordinator or their faculty delegate approves the intended internship a priori by reviewing the tasks in either the Internship Contract or Internship Confirmation from the respective internship institution or company. Further regulations as set out in the Policies for Bachelor Studies apply.

Students will be gradually prepared for the internship in semesters 1 to 4 through a series of mandatory information sessions, seminars, and career events.

The purpose of the Career Services Information Sessions is to provide all students with basic facts about the job market in general, and especially in Germany and the EU, and services provided by the Student Career Support.

In the Career Skills Seminars, students will learn how to engage in the internship/job search, how to create a competitive application (CV, Cover Letter, etc.), and how to successfully conduct themselves at job interviews and/or assessment centers. In addition to these mandatory sections, students can customize their skill set regarding application challenges and their intended career path in elective seminars.

Finally, during the Career Events organized by the Career Service Center (e.g. the annual Constructor Career Fair and single employer events on and off campus), students will have the opportunity to apply their acquired job market skills in an actual internship/job search situation and to gain their desired internship in a high-quality environment and with excellent employers.

As an alternative to the full-time internship, students can apply for the StartUp Option. Following the same schedule as the full-time internship, the StartUp Option allows students who are particularly interested in founding their own company to focus on the development of their business plan over a period of two consecutive months. Participation in the StartUp Option depends on a successful presentation of the student's initial StartUp idea. This presentation will be held at the beginning of the 4th semester. A jury of faculty members will judge the student's potential to realize their idea and approve the participation of the students. The StartUp Option is supervised by the Faculty StartUp Coordinator. At the end of StartUp Option, students submit their business plan. Further regulations as outlined in the Policies for Bachelor Studies apply.

The concluding Internship Event will be conducted within each study program (or a cluster of related study programs) and will formally conclude the module by providing students the opportunity to present on their internships and reflect on the lessons learned within their major area of study. The purpose of this event is not only to self-reflect on the whole internship process, but also to create a professional network within the academic community, especially by entering the Alumni Network after graduation. It is recommended that all three classes (years) of the same major are present at this event to enable networking between older and younger students and to create an educational environment for younger students to observe the "lessons learned" from the diverse internships of their elder fellow students.

Recommended Knowledge

- Information provided on CSC
- Major specific knowledge and skills
- Please see the section "Knowledge Center" at JobTeaser Career Center for information on Career Skills seminar and workshop offers and for online tutorials on the job market preparation and the application process. For more information, please see <https://constructor.university/student-life/career-services>
- Participating in the internship events of earlier classes

Usability and Relationship to other Modules

This module applies skills and knowledge acquired in previous modules to a professional environment and provides an opportunity to reflect on their relevance in employment and society. It may lead to thesis topics.

Intended Learning Outcomes

No	Competence	ILO
1	Describe	Describe the scope and the functions of the employment market and personal career development.
2	Apply	Apply professional, personal, and career-related skills for the modern labor market, including self-organization, initiative and responsibility, communication, intercultural sensitivity, team and leadership skills, etc.
3	Independently	Independently manage their own career orientation processes by identifying personal interests, selecting appropriate internship locations or start-up opportunities, conducting interviews, succeeding at pitches or assessment centers, negotiating related employment, managing their funding or support conditions (such as salary, contract, funding, supplies, work space, etc.).
4	Apply	Apply specialist skills and knowledge acquired during their studies to solve problems in a professional environment and reflect on their relevance in employment and society.
5	Justify	Justify professional decisions based on theoretical knowledge and academic methods.
6	Reflect	Reflect on their professional conduct in the context of the expectations of and consequences for employers and their society.
7	Reflect	Reflect on and set their own targets for the further development of their knowledge, skills, interests, and values.
8	Establish	Establish and expand their contacts with potential employers or business partners, and possibly other students and alumni, to build their own professional network to create employment opportunities in the future.
9	Discuss	Discuss observations and reflections in a professional network.

Module Description

This module is a mandatory graduation requirement for all undergraduate students to demonstrate their ability to address a problem from their respective major subject independently using academic/scientific methods within a set time frame. Although supervised, this module requires students to be able to work independently and systematically and set their own goals in exchange for the opportunity to explore a topic that excites and interests them personally and that a faculty member is interested in supervising. Within this module, students apply their acquired knowledge about their major discipline and their learned skills and methods for conducting research, ranging from the identification of suitable (short-term) research projects, preparatory literature searches, the realization of discipline-specific research, and the documentation, discussion, interpretation, and communication of research results.

This module consists of two components, an independent thesis and an accompanying seminar. The thesis component must be supervised by a Jacobs University faculty member and requires short-term research work, the results of which must be documented in a comprehensive written thesis including an introduction, a justification of the methods, results, a discussion of the results, and a conclusion. The seminar provides students with the opportunity to practice their ability to present, discuss, and justify their and other students' approaches, methods, and results at various stages of their research in order to improve their academic writing, receive and reflect on formative feedback, and therefore grow personally and professionally.

Recommended Knowledge

- Identify an area or a topic of interest and discuss this with your prospective supervisor in a timely manner.
- Create a research proposal including a research plan to ensure timely submission.
- Ensure you possess all required technical research skills or are able to acquire them on time.
- Review the University Code of Academic Integrity and Guidelines to Ensure Good Academic Practice.
- Comprehensive knowledge of the subject and deeper insight into the chosen topic
- ability to plan and undertake work independently
- skills to identify and critically review literature

Usability and Relationship to other Modules

This module builds on all previous modules in the undergraduate program. Students apply the knowledge, skills, and competencies they have acquired and practiced during their studies, including research methods and their ability to acquire additional skills independently as and if required.

Intended Learning Outcomes

No	Competence	ILO
1	Independently	Independently plan and organize advanced learning processes.
2	Design	Design and implement appropriate research methods, taking full account of the range of alternative techniques and approaches.
3	Collect	Collect, assess, and interpret relevant information.
4	Draw	Draw scientifically-founded conclusions that consider social, scientific, and ethical factors.
5	Apply	Apply their knowledge and understanding to a context of their choice.
6	Develop	Develop, formulate, and advance solutions to problems and debates within their subject area, and defend these through argument.
7	Discuss	Discuss information, ideas, problems, and solutions with specialists and non-specialists.

8 Constructor Track Modules

8.1 Methods

8.1.1 Matrix Algebra and Advanced Calculus I

Module Name	Matrix Algebra and Advanced Calculus I
Module Code	2025-CTMS-MAT-22
Module ECTS	5
Study Semester	Mandatory status for: - 2025-PHDS-BSc 1 - 2025-ECE-BSc 1 - 2025-PHDS-BSc 2 Mandatory Elective status for: - 2025-RIS-BSc 1 - 2025-CS-BSc 1 - 2025-SDT-BSc 1
Duration	1 Semester
Program Affiliation	2025-CT ()
Module Coordinator(s)	Prof. Dr. Keivan Mallahi Karai

Forms of Learning and Teaching	
Independent Study	90
Lecture	35
Workload Hours	125 hours

Module Components	Number	Type	CP
Matrix Algebra and Advanced Calculus I	CTMS-22	Lecture	5

Module Description

This module is the first in a sequence including advanced mathematical methods at the university level at a level higher than the course Calculus and Linear Algebra I.

The course comprises the following topics:

- Number systems, complex numbers
- The concept of function, composition of functions, inverse functions
- Basic ideas of calculus: Archimedes to Newton
- The notion of limit for functions and sequences and series
- Continuous function and their basic properties

- Derivatives: rate of change, velocity and applications
- Mean value theorem and estimation, maxima and minima, convex functions
- Integration, change of variables, Fundamental Theorem of Calculus
- Applications of the integral: work, area, average value, centre of mass
- Improper Integrals, Mean value theorem for integrals
- Taylor series
- Ordinary differential equations, examples, solving first order linear differential equations
- Basic ideas of numerical analysis, Newton's method, asymptotic formulas
- Review of elementary analytic geometry, lines, conics
- Vector spaces, linear independence, bases, coordinates
- Linear maps, matrices and their algebra, matrix inverses
- Gaussian elimination, solution space
- Determinants

Recommended Knowledge

- Knowledge of pre-calculus ideas (sets and functions, elementary functions, polynomials) and analytic geometry (equations of lines, systems of linear equations, dot product, polar coordinates) at High School level. Familiarity with ideas of calculus is helpful.
- Review of high school mathematics.

Usability and Relationship to other Modules

- Calculus and Linear Algebra I can be substituted with this module after consulting academic advisor
- A more advanced treatment of multi-variable Calculus, in particular, its applications in Physics and Mathematics, is provided in the second-semester module "Applied Mathematics". All students taking "Applied Mathematics" are expected to take this module as well as the module topics are closely synchronized.
- The second-semester module "Linear Algebra" provides a complete proof-driven development of the theory of Linear Algebra. Diagonalization is covered more abstractly, with particular emphasis on degenerate cases. The Jordan normal form is also covered in "Linear Algebra", not in this module.

Intended Learning Outcomes

No	Competence	ILO
1	Apply	Apply the methods described in the content section of this module description to the extent that they can
2	Solve	Solve standard text-book problems reliably and with confidence
3	Recognize	Recognize the mathematical structures in an unfamiliar context and translate them into a mathematical problem statement

4	Recognize	Recognize common mathematical terminology used in textbooks and research papers in the quantitative sciences, engineering, and mathematics to the extent that they fall into the content categories covered in this module

8.1.2 Matrix Algebra and Advanced Calculus II

Module Name	Matrix Algebra and Advanced Calculus II
Module Code	2025-CTMS-MAT-23
Module ECTS	5
Study Semester	Mandatory status for: - 2025-ECE-BSc 2 - 2025-PHDS-BSc 2 Mandatory Elective status for: - 2025-RIS-BSc 2 - 2025-CS-BSc 2 - 2025-SDT-BSc 2
Duration	1 Semester
Program Affiliation	2025-CT ()
Module Coordinator(s)	Prof. Dr. Keivan Mallahi Karai

Forms of Learning and Teaching	
Independent Study	90
Lecture	35
Workload Hours	125 hours

Module Components	Number	Type	CP
Matrix Algebra and Advanced Calculus II	CTMS-23	Lecture	5

Module Description

- Coordinate systems, functions of several variables, level curves, polar coordinates
- Continuity, directional derivatives, partial derivatives, chain rule (version I)
- derivative as a matrix, chain rule (version II), tangent planes and linear approximation, gradient, repeated partial derivatives
- Minima and Maxima of functions of several variables, Lagrange multipliers
- Multiple integrals, iterated integrals, integration over standard regions, change of variables formula
- Vector fields, parametric representation of curves, line integrals and arc length, conservative vector fields
- Potentials, Green's theorem in the plane
- Parametric representation of surfaces
- Vector products and normal surface integrals
- Integral theorems by Stokes and Gauss, physical interpretations

- Basics of differential forms and their calculus, connection to gradient, curl, and divergence
- Eigenvalues and eigenvectors, diagonalisable matrices
- Inner product spaces, Hermitian and unitary matrices
- Matrix factorizations: Singular value decomposition with applications, LU decomposition, QR decomposition
- Linear constant-coefficient ordinary differential equations, application to mechanical vibrations and electrical oscillations
- Periodic functions, Fourier series

Recommended Knowledge

Review the content of Matrix Algebra and Advanced Calculus I

Usability and Relationship to other Modules

- This module can substitute Calculus and Linear Algebra II after consulting academic advisor.
- Methods of this course are applied in the module Mathematical Modeling.
- The second-semester module Linear Algebra provides a more rigorous and more abstract treatment of some of the notions discussed in this module.

Intended Learning Outcomes

No	Competence	ILO
1	Understand	Understand the definitions of continuity, derivative of a function as a linear transformation, multivariable integrals, eigenvalues and eigenvectors and associated notions.
2	Apply	Apply the methods described in the content section of this module description to the extent that they can.
3	Evaluate	Evaluate multivariable integrals using definitions or by applying Green and Stokes theorem.
4	Evaluate	Evaluate various decompositions of matrices.
5	Solve	Solve standard text-book problems reliably and with confidence.
6	Recognize	Recognize the mathematical structures in an unfamiliar context and translate them into a mathematical problem statement.
7	Recognize	Recognize common mathematical terminology used in textbooks and research papers in the quantitative sciences, engineering, and mathematics to the extent that they fall into the content categories covered in this module.

8.1.3 Probability and Random Processes

Module Name	Probability and Random Processes
Module Code	2025-CTMS-MAT-12
Module ECTS	5
Study Semester	Mandatory status for: - 2025-PHDS-BSc 3 - 2025-RIS-BSc 3 - 2025-ECE-BSc 3 - 2025-MMDA-BSc 3 - 2025-CS-BSc 3 - 2025-SDT-BSc 3 - 2025-F-ACS-BSc 3 - 2025-S-ACS-BSc 4 Mandatory Elective status for: None
Duration	1 Semester
Program Affiliation	2025-CT ()
Module Coordinator(s)	Prof. Dr. Keivan Mallahi Karai

Forms of Learning and Teaching	
Independent Study	90
Lecture	35
Workload Hours	125 hours

Module Components	Number	Type	CP
Probability and random processes	CTMS-12	Lecture	5

Module Description

This module aims to provide a basic knowledge of probability theory and random processes suitable for students in engineering, Computer Science, and Mathematics. The module provides students with basic skills needed for formulating real-world problems dealing with randomness and probability in mathematical language, and methods for applying a toolkit to solve these problems. Mathematical rigor is used where appropriate. A more advanced treatment of the subject is deferred to the third-year module Stochastic Processes.

The lecture comprises the following topics:

- Brief review of number systems, elementary functions, and their graphs
- Outcomes, events and sample space
- Combinatorial probability
- Conditional probability and Bayes' formula

- Binomials and Poisson-Approximation
- Random Variables, distribution and density functions
- Independence of random variables
- Conditional Distributions and Densities
- Transformation of random variables
- Joint distribution of random variables and their transformations
- Expected Values and Moments, Covariance
- High dimensional probability: Chebyshev and Chernoff bounds
- Moment-Generating Functions and Characteristic Functions
- The Central limit theorem
- Random Vectors and Moments, Covariance matrix, Decorrelation
- Multivariate normal distribution. Markov chains, stationary distributions.

Recommended Knowledge

- Review all of the first-year calculus and linear algebra modules as indicated in "Entry Requirements - Knowledge, Ability, or Skills" above.
- Knowledge of calculus at the level of a first year calculus module (differentiation, integration with one and several variables, trigonometric functions, logarithms and exponential functions).
- Knowledge of linear algebra at the level of a first year university module (eigenvalues and eigenvectors, diagonalization of matrices).
- Some familiarity with elementary probability theory at the high school level.

Usability and Relationship to other Modules

Students taking this module are expected to be familiar with basic tools from calculus and linear algebra.

Intended Learning Outcomes

No	Competence	ILO
1	Command	Command the methods described in the content section of this module description to the extent that they can solve standard text-book problems reliably and with confidence.
2	Recognize	Recognize the probabilistic structures in an unfamiliar context and translate them into a mathematical problem statement.
3	Recognize	Recognize common mathematical terminology used in textbooks and research papers in the quantitative sciences, engineering, and mathematics to the extent that they fall into the content categories covered in this module.

8.1.4 Numerical Methods

Module Name	Numerical Methods
Module Code	2025-CTMS-MAT-13
Module ECTS	5
Study Semester	Mandatory status for: - 2025-ECE-BSc 4 Mandatory Elective status for: - 2025-CS-BSc 4 - 2025-RIS-BSc 4
Duration	1 Semester
Program Affiliation	2025-CT ()
Module Coordinator(s)	Prof. Dr. Keivan Mallahi Karai

Forms of Learning and Teaching	
Independent Study	90
Lecture	35
Workload Hours	125 hours

Module Components	Number	Type	CP
Numerical Methods	CTMS-13	Lecture	5

Module Description

This module covers calculus-based numerical methods, in particular root finding, interpolation, approximation, numerical differentiation, numerical integration (quadrature), and a first introduction to the numerical solution of differential equations.

The lecture comprises the following topics:

- number representations
- Gaussian elimination
- LU decomposition
- Cholesky decomposition
- iterative methods
- bisection method
- Newton's method
- secant method
- polynomial interpolation
- Aitken's algorithm
- Lagrange interpolation
- Newton interpolation
- Hermite interpolation
- Bezier curves
- De Casteljau's algorithm
- piecewise interpolation

- Spline interpolation
- B-Splines
- Least-squares approximation
- polynomial regression
- difference schemes
- Richardson extrapolation
- Quadrature rules
- Monte Carlo integration
- time stepping schemes for ordinary differential equations
- Runge Kutta schemes
- finite difference method for partial differential equations

Recommended Knowledge

- Taking Calculus and Elements of Linear Algebra II before taking this module is recommended, but not required. A thorough review of Calculus and Elements of Linear Algebra, with emphasis on the topics listed below is recommended.

- Knowledge of Calculus (functions, inverse functions, sets, real numbers, sequences and limits, polynomials, rational functions, trigonometric functions, logarithm and exponential function, parametric equations, tangent lines, graphs, derivatives, anti-derivatives, elementary

techniques for solving equations)

- Knowledge of Linear Algebra (vectors, matrices, lines, planes, n-dimensional Euclidean vector space, rotation, translation, dot product (scalar product), cross product, normal vector, eigenvalues, eigenvectors, elementary techniques for solving

systems of linear equations)

Usability and Relationship to other Modules

This module is a co-recommendation for the module “Applied Dynamical Systems Lab”, in which the actual implementation in a high-level programming language of the learned methods will be covered.

Intended Learning Outcomes

No	Competence	ILO
1	Describe	Describe the basic principles of discretization used in the numerical treatment of continuous problems.
2	Command	Command the methods described in the content section of this module description to the extent that they can solve standard text-book problems reliably and with.
3	Recognize	Recognize mathematical terminology used in textbooks and research papers on numerical methods in the quantitative sciences, engineering, and mathematics to the extent that they fall into the content categories covered in this module.
4	Implement	Implement simple numerical algorithms in a high-level programming language.
5	Understand	Understand the documentation of standard numerical library code and understand the potential limitations and caveats of such algorithms.

Logic (perspective I)	CTNS-01	Lecture (Online)	2.5

Module Description

Suppose a friend asks you to help solve a complicated problem? Where do you begin? Arguably, the first and most difficult task you face is to figure out what the heart of the problem actually is. In doing that you will look for structural similarities between the problem posed and other problems that arise in different fields that others may have addressed successfully. Those similarities may point you to a pathway for resolving the problem you have been asked to solve. But it is not enough to look for structural similarities. Sometimes relying on similarities may even be misleading. Once you've settled tentatively on what you take to be the heart of the matter, you will naturally look for materials, whether evidence or arguments, that you believe is relevant to its potential solution. But the evidence you investigate of course depends on your formulation of the problem, and your formulation of the problem likely depends on the tools you have available - including potential sources of evidence and argumentation. You cannot ignore this interactivity, but you can't allow yourself to be hamstrung entirely by it. But there is more. The problem itself may be too big to be manageable all at once, so you will have to explore whether it can be broken into manageable parts and if the information you have bears on all or only some of those parts. And later you will face the problem of whether the solutions to the particular sub problems can be put together coherently to solve the entire problem taken as a whole.

What you are doing is what we call engaging in computational thinking. There are several elements of computational thinking illustrated above. These include: Decomposition (breaking the larger problem down into smaller ones); Pattern recognition (identifying structural similarities); Abstraction (ignoring irrelevant particulars of the problem); and Creating Algorithms), problem-solving formulas.

But even more basic to what you are doing is the process of drawing inferences from the material you have. After all, how else are you going to create a problem-solving formula, if you draw incorrect inferences about what information has shown and what, if anything follows logically from it. What you must do is apply the rules of logic to the information to draw inferences that are warranted.

We distinguish between informal and formal systems of logic, both of which are designed to indicate fallacies as well as warranted inferences. If I argue for a conclusion by appealing to my physical ability to coerce you, I prove nothing about the truth of what I claim. If anything, by doing so I display my lack of confidence in my argument. Or if the best I can do is berate you for your skepticism, I have done little more than offer an ad hominem instead of an argument. Our focus will be on formal systems of logic, since they are at the heart of both scientific argumentation and computer developed algorithms. There are in fact many different kinds of logic and all figure to varying degrees in scientific inquiry. There are inductive types of logic, which purport to formalize the relationship between premises that if true offer evidence on behalf of a conclusion and the conclusion and are represented as claims about the extent to which the conclusion is confirmed by the premises. There are deductive types of logic, which introduce a different relationship between premise and conclusion. These variations of logic consist in rules that if followed entail that if the premises are true then the conclusion too must be true.

There are also modal types of logic which are applied specifically to the concepts of necessity and possibility, and thus to the relationship among sentences that include either or both those terms. And there is also what are called deontic logic, a modification of logic that purport to show that there are rules of inference that allow us to infer what we ought to do from facts about the circumstances in which we find ourselves. In the natural and social sciences most of the emphasis has been placed on inductive logic, whereas in math it is placed on deductive logic, and in modern physics there is an increasing interest in the concepts of possibility and necessity and thus in modal logic. The humanities, especially normative discussions in philosophy and literature are the province of deontic logic.

This module will also take students through the central aspects of computational thinking, as it is related to logic; it will introduce the central concepts in each, their relationship to one another and begin to provide the conceptual apparatus and practical skills for scientific inquiry and research.

Intended Learning Outcomes

No	Competence	ILO
1	Apply	Apply the various principles of logic and expand them to computational thinking.
2	Understand	Understand the way in which logical processes in humans and in computers are similar and different at the same time.
3	Apply	Apply the basic rules of first-order deductive logic and employ them rules in the context of creating a scientific or social scientific study and argument.
4	Employ	Employ those rules in the context of creating a scientific or social scientific study and argument.

Module Description

The focus of this module is on formal systems of logic, since they are at the heart of both scientific argumentation and computer developed algorithms. There are in fact many kinds of logic and all figure to varying degrees in scientific inquiry. There are inductive types of logic, which purport to formalize the relationship between premises that if true offer evidence on behalf of a conclusion and the conclusion and are represented as claims about the extent to which the conclusion is confirmed by the premises. There are deductive types of logic, which introduce a different relationship between premise and conclusion. These variations of logic consist in rules that if followed entail that if the premises are true then the conclusion too must be true.

This module introduces logics that go beyond traditional deductive propositional logic and predicate logic and as such it is aimed at students who are already familiar with basics of traditional formal logic. The aim of the module is to provide an overview of alternative logics and to develop a sensitivity that there are many different logics that can provide effective tools for solving problems in specific application domains.

The module first reviews the principles of a traditional logic and then introduces many-valued logics that distinguish more than two truth values, for example true, false, and unknown. Fuzzy logic extends traditional logic by replacing truth values with real numbers in the range 0 to 1 that are expressing how strong the believe into a proposition is. Modal logics introduce modal operators expressing whether a proposition is necessary or possible. Temporal logics deal with propositions that are qualified by time. One can view temporal logics as a form of modal logics where propositions are qualified by time

constraints. Interval temporal logic provides a way to reason about time intervals in which propositions are true.

The module will also investigate the application of logic frameworks to specific classes of problems. For example, a special subset of predicate logic, based on so-called Horn clauses, forms the basis of logic programming languages such as Prolog. Description logics, which are usually decidable logics, are used to model relationships and they have applications in the semantic web, which enables search engines to reason about resources present on the Internet.

Intended Learning Outcomes

No	Competence	ILO
1	Apply	Apply the various principles of logic.
2	Explain	Explain practical relevance of non-standard logic.
3	Describe	Describe how many-valued logic extends basic predicate logic.
4	Apply	Apply basic rules of fuzzy logic to calculate partial truth values.
5	Sketch	Sketch basic rules of temporal logic.
6	Implement	Implement predicates in a logic programming language.
7	Prove	Prove some simple non-standard logic theorems.

Module Description

In many ways, life is a journey. And also, as in other journeys, our success or failure depends not only on our personal traits and character, our physical and mental health, but also on the accuracy of our map. We need to know what the world we are navigating is actually like, the how, why and the what of what makes it work the way it does. The natural sciences provide the most important tool we have developed to learn how the world works and why it works the way it does. The social sciences provide the most advanced tools we have to learn how we and other human beings, similar in most ways, different in many others, act and react and what makes them do what they do. In order for our maps to be useful, they must be accurate and correctly reflect the way the natural and social worlds work and why they work as they do.

The natural sciences and social sciences are blessed with enormous amounts of data. In this way, history and the present are gifts to us. To understand how and why the world works the way it does requires that we are able to offer an explanation of it. The data supports a number of possible explanations of it. How are we to choose among potential explanations? Explanations, if sound, will enable us to make reliable predictions about what the future will be like, and also to identify many possibilities that may unfold in the future. But there are differences not just in the degree of confidence we have in our predictions, but in whether some of them are necessary future states or whether all of them are merely possibilities? Thus, there are three related activities at the core of scientific inquiry: understanding where we are now and how we got here (historical); knowing what to expect going forward (prediction); and exploring how we can change the paths we are on (creativity).

At the heart of these activities are certain fundamental concepts, all of which are related to the scientific quest to uncover immutable and unchanging laws of nature. Laws of nature are thought to reflect a causal nexus between a previous event and a future one. There are also true statements that reflect universal or nearly universal connections between events past and present that are not laws of nature because the relationship they express is that of a correlation between events. A working thermostat accurately allows us to determine or even to predict the temperature in the room in which it is located, but it does not explain why the room has the temperature it has. What then is the core difference between causal relationships and correlations? At the same time, we all recognize that given where we are now there are many possible futures for each of us, and even had our lives gone just the slightest bit differently than they have, our present state could well have been very different than it is. The relationship between possible pathways between events that have not materialized but could have is expressed through the idea of counterfactual.

Creating accurate roadmaps, forming expectations we can rely on, making the world a more verdant and attractive place requires us to understand the concepts of causation, correlation, counterfactual explanation, prediction, necessity, possibility, law of nature and universal generalization. This course is designed precisely to provide the conceptual tools and intellectual skills to implement those concepts in our future readings and research and ultimately in our experimental investigations, and to employ those tools in various disciplines.

Intended Learning Outcomes

No	Competence	ILO
1	Formulate	Formulate testable hypotheses that are designed to reveal causal connections and those designed to reveal interesting, important and useful correlations.
2	Distinguish	Distinguish scientifically interesting correlations from unimportant ones.
3	Apply	Apply critical thinking skills to evaluate information.
4	Understand	Understand when and why inquiry into unrealized possibility is important and relevant.

Module Description

Causality or causation is a surprisingly difficult concept to understand. David Hume famously noted that causality is a concept that our science and philosophy cannot do without, but it is equally a concept that our science and philosophy cannot describe. Since Hume, the problem of cause has not gone away, and sometimes seems to get even worse (e.g., quantum mechanics confusing previous notions of causality). Yet, ways of doing science that lessen our need to explicitly use causality have become very effective (e.g., huge developments in statistics). Nevertheless, it still seems that the concept of causality is at the core of explaining how the world works, across fields as diverse as physics, medicine, logistics, the law, sociology, and history - and ordinary daily life - through all of which, explanations and predictions in terms of cause and effect remain intuitively central.

Causality remains a thorny problem but, in recent decades, significant progress has occurred, particularly in work by or inspired by Judea Pearl. This work incorporates many 20th century developments, including statistical methods - but with a reemphasis on finding the why, or the cause, behind statistical correlations -, progress in understanding the logic, semantics and metaphysics of conditionals and counterfactuals, developments based on insights from the likes of philosopher Hans Reichenbach or biological statistician Sewall Wright into causal precedence and path analysis, and much more. The result is a new toolkit to identify causes and build causal explanations. Yet even as we

get better at identifying causes, this raises new (or old) questions about causality, including metaphysical questions about the nature of causes (and effects, events, objects, etc), but also questions about what we really use causality for (understanding the world as it is or just to glean predictive control of specific outcomes), about how causality is used differently in different fields and activities (is cause in physics the same as that in history?), and about how other crucial concepts relate to our concept of cause (space and time seem to be related to causality, but so do concepts of legal and moral responsibility).

This course will introduce students to the mathematical formalism derived from Pearl's work, based on directed acyclic graphs and probability theory. Building upon previous work by Reichenbach and Wright, Pearl defines a "a calculus of interventions" or "do-calculus" for talking about interventions and their relation to causation and counterfactuals. This model has been applied in various areas ranging from econometrics to statistics, where acquiring knowledge about causality is of great importance.

At the same time, the course will not forget some of the metaphysical and epistemological issues around cause, so that students can better critically evaluate putative causal explanations in their full context. Abstractly, such issues involve some of the same philosophical questions Hume already asked, but more practically, it is important to see how metaphysical and epistemological debates surrounding the notion of cause affect scientific practice, and equally if not more importantly, how scientific practice pushes the limits of theory. This course will look at various ways in which empirical data can be transformed into explanations and theories, including the variance approach to causality (characteristic of the positivistic quantitative paradigm), and the process theory of causality (associated with qualitative methodology). Examples and case studies will be relevant for students of the social sciences but also students of the natural/physical world as well.

Recommended Knowledge

Basic probability theory

Intended Learning Outcomes

No	Competence	ILO
1	Have	Have a clear understanding of the history of causal thinking.
2	Form	Form a critical understanding of the key debates and controversies surrounding the idea of causality.
3	Recognize	Recognize and apply probabilistic causal models.
4	Explain	Explain how understanding of causality differs among different disciplines.
5	Demonstrate	Demonstrate how theoretical thinking about causality has shaped scientific practices.

8.2.5 Linear Model and Matrices

Module Name	Linear Model and Matrices
Module Code	2025-CTNS-NSK-05
Module ECTS	5
Study Semester	Mandatory status for: None Mandatory Elective status for: - 2025-ECE-BSc 5
Duration	1 Semester
Program Affiliation	2025-CT ()
Module Coordinator(s)	Prof. Dr. Marc-Thorsten Hütt

Forms of Learning and Teaching	
Independent Study	90
Online Lecture	35
Workload Hours	125 hours

Module Components	Number	Type	CP
Linear model and matrices	CTNS-05	Seminar (Online)	5

Module Description

There are no universal 'right skills'. But the notion of linear models and the avenue to matrices and their properties can be useful in diverse disciplines to implement a quantitative, computational approach. Some of the most popular data and systems analysis strategies are built upon this framework. Examples include principal component analysis (PCA), the optimization techniques used in Operations Research (OR), the assessment of stable and unstable states in nonlinear dynamical systems, as well as aspects of machine learning.

Here we introduce the toolbox of linear models and matrix-based methods embedded in a wide range of transdisciplinary applications (part 1). We describe its foundation in linear algebra (part 2) and the range of tools and methods derived from this conceptual framework (part 3). At the end of the course, we outline applications to graph theory and machine learning (part 4). Matrices can be useful representations of networks and of system of linear equations. They are also the core object of linear stability analysis, an approach used in nonlinear dynamics. Throughout the course, examples from neuroscience, social sciences, medicine, biology, physics, chemistry, and other fields are used to illustrate these methods.

A strong emphasis of the course is on the sensible usage of linear approaches in a nonlinear world. We will critically reflect the advantages as well as the disadvantages and limitations of this method. Guiding questions are: How appropriate is a linear approximation of a nonlinear system? What do you really learn from PCA? How reliable are the optimal states obtained via linear programming (LP) techniques?

This debate is embedded in a broader context: How does the choice of a mathematical technique confine your view on the system at hand? How, on the other hand, does it increase your capabilities of analyzing the system (due to software available for this technique, the ability to compare with findings from other fields built upon the same technique and the volume of knowledge about this technique)?

In the end, students will have a clearer understanding of linear models and matrix approaches in their own discipline, but they will also see the full transdisciplinarity of this topic. They will make better decisions in their choice of data analysis methods and become mindful of the challenges when going from linear to nonlinear thinking.

Intended Learning Outcomes

No	Competence	ILO
1	Apply	Apply the concept of linear modeling in their own discipline.
2	Distinguish	Distinguish between linear and nonlinear interpretation strategies and understand the range of applicability of linear models.
3	Make	Make use of data analysis / data interpretation strategies from other disciplines, which are derived from linear algebra.
4	Be	Be aware of the ties that linear models have to machine learning and network theory,
5	Note	Note that these four ILOs can be loosely associated with the four parts of the course indicated above.

Online Lecture	35
Workload Hours	125 hours

Module Components	Number	Type	CP
Complex Problem Solving	CTNS-06	Lecture (Online)	5

Module Description

Complex problems are, by definition, non-linear and/or emergent. Some fifty years ago, scholars such as Herbert Simon began to argue that societies around the world had developed an impressive array of tools with which to solve simple and even complicated problems, but still needed to develop methods with which to address the rapidly increasing number of complex issues. Since then, a variety of such methods has emerged. These include 'serious games' developed in computer science, 'multisector systems analysis' applied in civil and environmental engineering, 'robust decision-making' proposed by the RAND Corporation, 'design thinking' developed in engineering and business studies, 'structured problem-solving' used by McKinsey & Co., 'real-time technology assessment' advocated in science and technology studies, and 'deliberative decision-making' emanating from political science.

In this course, students first learn to distinguish between simple, complicated and complex problems. They also become familiar with the ways in which a particular issue can sometimes shift from one category into another. In addition, the participants learn to apply several tools for resolving complex problems. Finally, the students are introduced to the various ways in which natural and social scientists can help stakeholders resolve complex problems. Throughout the course examples and applications will be used. When possible, guest lectures will be offered by experts on a particular tool for tackling complex issues. For the written, take-home exam, students will have to select a specific complex problem, analyse it and come up with a recommendation - in addition to answering several questions about the material learned.

Recommended Knowledge

Online Lecture	35
Workload Hours	125 hours

Module Components	Number	Type	CP
Argumentation, Data Visualization and Communication (perspective I)	CTNS-07	Lecture (Online)	5

Module Description

One must be careful not to confuse argumentation with being argumentative. The latter is an unattractive personal attribute, whereas the former is a requirement of publicly holding a belief, asserting the truth of a proposition, the plausibility of a hypothesis, or a judgment of the value of a person or an asset. It is an essential component of public discourse. Public discourse is governed by norms and one of those norms is that those who assert the truth of a proposition or the validity of an argument or the responsibility of another for wrongdoing open themselves up to good faith requests to defend their claims. In its most general meaning, argumentation is the requirement that one offer evidence in support of the claims they make, as well as in defense of the judgments and assessments they reach. There are different modalities of argumentation associated with different contexts and disciplines. Legal arguments have a structure of their own as do assessments of medical conditions and moral character. In each case, there are differences in the kind of evidence that is thought relevant and, more importantly, in the standards of assessment for whether a case has been successfully made. Different modalities of argumentation require can call for different modes of reasoning. We not only offer reasons in defense of or in support of beliefs we have, judgments we make and hypotheses we offer, but we reason from evidence we collect to conclusions that are warranted by them.

Reasoning can be informal and sometimes even appear unstructured. When we recognize some reasoning as unstructured yet appropriate what we usually have in mind is that it is not linear. Most reasoning we are familiar with is linear in character. From A we infer B, and from A and B we infer C, which all together support our commitment to D. The same form of reasoning applies whether the evidence for A, B or C is direct or circumstantial. What changes in these cases is perhaps the weight we give to the evidence and thus the confidence we have in drawing inferences from it.

Especially in cases where reasoning can be supported by quantitative data, wherever quantitative data can be obtained either directly or by linear or nonlinear models, the visualization of the corresponding data can become key in both, reasoning and argumentation. A graphical representation can reduce the complexity of argumentation and is considered a must in effective scientific communication. Consequently, the course will also focus on smart and compelling ways for data visualization - in ways that go beyond what is typically taught in statistics or mathematics lectures. These tools are constantly developing, as a reflection of new software and changes in state of the presentation art. Which graph or bar chart to use best for which data, the use of colors to underline messages and arguments, but also the pitfalls when presenting data in a poor or even misleading manner. This will also help in readily identifying intentional mis-representation of data by others, the simplest to recognize being truncating the ordinate of a graph in order to exaggerate trends. This frequently leads to false arguments, which can then be readily countered.

There are other modalities of reasoning that are not linear however. Instead they are coherentist. We argue for the plausibility of a claim sometimes by showing that it fits in with a set of other claims for which we have independent support. The fit is itself the reason that is supposed to provide confidence or grounds for believing the contested claim.

Other times, the nature of reasoning involves establishing not just the fit but the mutual support individual items in the evidentiary set provide for one another. This is the familiar idea of a web of interconnected, mutually supportive beliefs. In some cases, the support is in all instances strong; in others it is uniformly weak, but the set is very large; in other cases, the support provided each bit of evidence for the other is mixed: sometimes strong, sometimes weak, and so on.

There are three fundamental ideas that we want to extract from this segment of the course. These are (1) that argumentation is itself a requirement of being a researcher who claims to have made findings of one sort or another; (2) that there are different forms of appropriate argumentation for different domains and circumstances; and (3) that there are different forms of reasoning on behalf of various claims or from various bits of evidence to conclusions: whether those conclusions are value judgments, political beliefs, or scientific conclusions. Our goal is to familiarize you with all three of these deep ideas and to help you gain facility with each.

Intended Learning Outcomes

No	Competence	ILO
1	Distinguish	Distinguish among different modalities of argument, e.g. legal arguments, vs. scientific ones.
2	Construct	Construct arguments using tools of data visualization.
3	Communicate	Communicate conclusions and arguments concisely, clearly and convincingly.

Module Components	Number	Type	CP
Argumentation, Data Visualization and Communication (perspective II)	CTNS-08	Lecture (Online)	5

Module Description

Humans are a social species, and interaction is crucial throughout the entire life span. While much of human communication involves language, there is a complex multichannel system of nonverbal communication that enriches linguistic content, provides context, and is also involved in structuring dynamic interaction. Interactants achieve goals by encoding information that is interpreted in the light of current context in transactions with others. This complexity implies also that there are frequent misunderstandings as a sender's intention is not fulfilled. Students in this course will learn to understand the structure of communication processes in a variety of formal and informal contexts. They will learn what constitutes challenges to achieving successful communication and to how to communicate effectively, taking the context and specific requirements for a target audience into consideration. These aspects will be discussed also in the scientific context, as well as business, and special cases, such as legal context - particularly with view to argumentation theory.

Communication is a truly transdisciplinary concept that involves knowledge from diverse fields such as biology, psychology, neuroscience, linguistics, sociology, philosophy, communication and information science. Students will learn what these different disciplines contribute to an understanding of communication and how theories from these fields can be applied in the real world. In the context of

scientific communication, there will also be a focus on visual communication of data in different disciplines. Good practice examples will be contrasted with typical errors to facilitate successful communication also with view to the Bachelor's thesis.

Recommended Knowledge

- Ability and openness to engage in interactions
- Media literacy, critical thinking and a proficient handling of data sources
- Own research in academic literature

Intended Learning Outcomes

No	Competence	ILO
1	Analyze	Analyze communication processes in formal and informal contexts.
2	Identify	Identify challenges and failures in communication.
3	Design	Design communications to achieve specified goals to specific target groups.
4	Understand	Understand the principles of argumentation theory.
5	Use	Use data visualization in scientific communications.

Module Components	Number	Type	CP
Agency, Leadership, and Accountability	CTNS-09	Lecture (Online)	5

Module Description

Each of us is judged by the actions we undertake and held to account for the consequences of them. Sometimes we may be lucky and our bad acts don't have harmful effects on others. Other times we may be unlucky and reasonable decisions can lead to unexpected or unforeseen adverse consequences for others. We are therefore held accountable both for choices and for outcomes. In either case, accountability expresses the judgment that we bear responsibility for what we do and what happens as a result. But our responsibility and our accountability in these cases is closely connected to the idea that we have agency.

Agency presumes that we are the source of the choices we make and the actions that result from those choices. For some, this may entail the idea that we have free will. But there is scientific world view that holds that all actions are determined by the causes that explain them, which is the idea that if we knew the causes of your decisions in advance, we would know the decision you would make even before you made it. If that is so, how can your choice be free? And if it is not free, how can you be responsible for it? And if you cannot be responsible, how can we justifiably hold you to account for it?

These questions express the centuries old questions about the relationship between free will and a determinist world view: for some, the conflict between a scientific world view and a moral world view.

But we do not always act as individuals. In society we organize ourselves into groups: e.g. tightly organized social groups, loosely organized market economies, political societies, companies, and more.

These groups have structure. Some individuals are given the responsibility of leading the group and of exercising authority. But one can exercise authority over others in a group merely by giving orders and threatening punishment for non-compliance.

Exercising authority is not the same thing as being a leader? For one can lead by example or by encouraging others to exercise personal judgment and authority. What then is the essence of leadership?

The module has several educational goals. The first is for students to understand the difference between actions that we undertake for which we can reasonably held accountable and things that we do but which we are not responsible for. For example, a twitch is an example of the latter, but so too may be a car accident we cause as a result of a heart attack we had no way of anticipating or controlling. This suggests the importance of control to responsibility. At the heart of personal agency is the idea of control. The second goal is for students to understand what having control means. Some think that the scientific view is that the world is deterministic, and if it is then we cannot have any personal control over what happens, including what we do. Others think that the quantum scientific view entails a degree of indeterminacy and that free will and control are possible, but only in the sense of being unpredictable or random. But then random outcomes are not ones we control either. So, we will devote most attention to trying to understand the relationships between control, causation and predictability.

But we do not only exercise agency in isolation. Sometimes we act as part of groups and organizations. The law often recognizes ways in which groups and organizations can have rights, but is there a way in which we can understand how groups have responsibility for outcomes that they should be accountable for. We need to figure out then whether there is a notion of group agency that does not simply boil down to the sum of individual actions. We will explore the ways in which individual actions lead to collective agency.

Finally, we will explore the ways in which occupying a leadership role can make one accountable for the actions of others over which one has authority.

Intended Learning Outcomes

No	Competence	ILO
1	Understand	Understand and reflect how the social and moral world views that rely on agency and responsibility are compatible, if they are, with current scientific world views.
2	Understand	Understand how science is an economic sector, populated by large powerful organizations that set norms, fund research agendas.
3	Identify	Identify the difference between being a leader of others or of a group - whether a research group or a lab or a company - and being in charge of the group.
4	Learn	Learn to be a leader of others and groups. Understand that when one graduates one will enter not just a field of work but a heavily structured set of institutions and that one's agency and responsibility for what happens, what work gets done, its quality and value, will be affected accordingly.

Entry Requirements

Prerequisites	None
Co-requisites	None
Additional Remarks	None

Assessment and Completion

Components	Examination Type	Duration /Length	Weight (%)	Minimum	ILOs
Agency, Leadership, and Accountability	Written Examination	120 minutes	100	45%	1-4

Module Achievements: None

8.2.10 Community Impact Project

Module Name	Community Impact Project
Module Code	2025-CTNS-CIP-10
Module ECTS	5
Study Semester	Mandatory status for: None Mandatory Elective status for: - 2025-ECE-BSc 5 - 2025-ECE-BSc 6
Duration	1 Semester
Program Affiliation	2025-CT ()
Module Coordinator(s)	CIP Faculty Coordinator

Forms of Learning and Teaching	
Introductory, Accompanying, and Final Events	10
Self-Organized Teamwork	115
Workload Hours	125 hours

Module Components	Number	Type	CP
Community Impact Project	CTNS-10	Project	5

Module Description

CIPs are self-organized, major-related, and problem-centered applications of students' acquired knowledge and skills. These activities will ideally be connected to their majors so that they will challenge the students' sense of practical relevance and social responsibility within the field of their studies. Projects will tackle real issues in their direct and/or broader social environment. These projects ideally connect the campus community to other communities, companies, or organizations in a mutually beneficial way.

Students are encouraged to create their own projects and find partners (e.g., companies, schools, NGOs), but will get help from the CIP faculty coordinator team and faculty mentors to do so. They can join and collaborate in interdisciplinary groups that attack a given issue from different disciplinary perspectives.

Student activities are self-organized but can draw on the support and guidance of both faculty and the CIP faculty coordinator team.

Usability and Relationship to other Modules

Students who have accomplished their CIP (6th semester) are encouraged to support their fellow students during the development phase of the next year's projects (4th semester).

Recommended Knowledge

- Basic knowledge of the main concepts and methodological instruments of the respective disciplines.
- Develop or join a community impact project before the 5th or 6th semester based on the introductory events during the 4th semester by using the database of projects, communicating with fellow students and faculty, and finding potential companies, organizations, or communities to target.

Intended Learning Outcomes

No	Competence	ILO
1	The	The Community Impact Project is designed to convey the required personal and social competencies for enabling students to finish their studies at Constructor University as socially conscious and responsible graduates (part of the Constructor University's mission) and to convey social and personal abilities to the students, including a practical awareness of the societal context and relevance of their academic discipline.
2	Understand	Understand the real-life issues of communities, organizations, and industries and relate them to concepts in their own discipline.
3	Enhance	Enhance problem-solving skills and develop critical faculty, create solutions to problems, and communicate these solutions appropriately to their audience.
4	Apply	Apply media and communication skills in diverse and non-peer social contexts.
5	Develop	Develop an awareness of the societal relevance of their own scientific actions and a sense of social responsibility for their social surroundings.
6	Reflect	Reflect on their own behavior critically in relation to social expectations and consequences.
7	Work	Work in a team and deal with diversity, develop cooperation and conflict skills, and strengthen their empathy and tolerance for ambiguity.

8.3 Language and Humanities

8.3.1 Language

The descriptions of the language modules are provided in a separate document, the “Language Module Handbook” that can be accessed from the Constructor University’s Language & Community Center internet sites (<https://constructor.university/student-life/language-community-center/learning-languages>).

8.3.2 Humanities

8.3.2.1 Introduction to the Philosophy of Science

Module Name	Introduction to the Philosophy of Science
Module Code	2025-CTHU-HUM-002
Module ECTS	2.5
Study Semester	Mandatory status for: None Mandatory Elective status for: - 2025-ECE-BSc 1 - 2025-ECE-BSc 2
Duration	1 Semester
Program Affiliation	2025-CT ()
Module Coordinator(s)	Dr. Eoin Ryan

Forms of Learning and Teaching	
Independent Study	45
Online Lecture	17.5
Workload Hours	62.5 hours

Module Components	Number	Type	CP
Introduction to the Philosophy of Science	CTHU-002	Lecture (Online)	2.5

Module Description

This humanities module will introduce students to some of the central ideas in philosophy of science. Topics will include distinguishing science from pseudo-science, types of inference and the problem of induction, the pros and cons of realism and anti-realism, the role of explanation, the nature of scientific change, the difference between natural and social sciences, scientism and the values of science, as well as some examples from philosophy of the special sciences (e.g., physics, biology).

The course aims to give students an understanding of how science produces knowledge, and some of the various contexts and issues which mean this process is never entirely transparent, neutral, or unproblematic. Students will gain a critical understanding of science as a human practice and technology; this will enable them both to better understand the importance and success of science, but also how to properly critique science when appropriate.

Intended Learning Outcomes

No	Competence	ILO
1	Understand	Understand key ideas from the philosophy of science.
2	Discuss	Discuss different types of inference and rational processes.

3	Describe	Describe differences between how the natural sciences, social sciences and humanities discover knowledge.
4	Identify	Identify ways in which science can be more and less value-laden.
5	Illustrate	Illustrate some important conceptual leaps in the history of science.

Indicative Literature

Independent Study	45
Online Lecture	17.5
Workload Hours	62.5 hours

Module Components	Number	Type	CP
Introduction to Philosophical Ethics	CTHU-001	Lecture (Online)	2.5

Module Description

The nature of morality - how to lead a life that is good for yourself, and how to be good towards others - has been a central debate in philosophy since the time of Socrates, and it is a topic that continues to be vigorously discussed. This course will introduce students to some of the key aspects of philosophical ethics, including leading normative theories of ethics (e.g. consequentialism or utilitarianism, deontology, virtue ethics, natural law ethics, egoism) as well as some important questions from metaethics (are useful and generalizable ethical claims even possible; what do ethical speech and ethical judgements actually do or explain) and moral psychology (how do abstract ethical principles do when realized by human psychologies). The course will describe ideas that are key factors in ethics (free will, happiness, responsibility, good, evil, religion, rights) and indicate various routes to progress in understanding ethics, as well as some of their difficulties.

Intended Learning Outcomes

No	Competence	ILO
1	Describe	Describe normative ethical theories such as consequentialism, deontology and virtue ethics.
2	Discuss	Discuss some metaethical concerns.
3	Analyze	Analyze ethical language.
4	Highlight	Highlight complexities and contradictions in typical ethical commitments.

5	Indicate	Indicate common parameters for ethical discussions at individual and social levels.
6	Analyze	Analyze notions such as objectivity, subjectivity, universality, pluralism, value.

Indicative Literature

Forms of Learning and Teaching	
Independent Study	45
Online Lecture	17.5
Workload Hours	62.5 hours

Module Components	Number	Type	CP
Introduction to Visual Culture	CTHU-003	Lecture (Online)	2.5

Module Description

Of the five senses, the sense of sight has for a long time occupied the central position in human cultures. As John Berger has suggested this could be because we can see and recognize the world around us before we learn how to speak. Images have been with us since the earliest days of the human history. In fact, the earliest records of human history are images found on cave walls across the world. We use images to capture abstract ideas, to catalogue and organize the world, to represent the world, to capture specific moments, to trace time and change, to tell stories, to express feelings, to better understand, to provide evidence and more. At the same time, images exert their power on us, seducing us into believing in their 'innocence', that is into forgetting that as representations they are also interpretations, i.e., a particular version of the world.

The purpose of this course is to explore multiple ways in which images and the visual in general mediate and structure human experiences and practices from more specialized discourses, e.g., scientific discourses, to more informal and personal day-to-day practices, such as self-fashioning in cyberspace. We will look at how social and historical contexts affect how we see, as well as what is visible and what is not. We will explore the centrality of the visual to the intellectual activity, from early genres of scientific drawing to visualizations of big data. We will examine whether one can speak of visual culture of protest, look at the relationship between looking and subjectivity and, most importantly, ponder the relationship between the visual and the real.

Intended Learning Outcomes

No	Competence	ILO
-----------	-------------------	------------

1	Understand	Understand a range of key concepts pertaining to visual culture, art theory and cultural analysis.
2	Understand	Understand the role of visuality in the development and maintenance of political, social, and intellectual discourses.
3	Think	Think critically about images and their contexts.
4	Reflect	Reflect critically on the connection between seeing and knowing.
